▼ Market Temperature

My Buy Window is: Selectively Open.

Always cut losses in 33% lots at -3%, -5% & -7%—additional personal disclaimer at

the bottom. All buy ideas require a significant pickup in volume to validate the breakout or buy

point—minimum volume pickup of 40%, ideally 500%+.

0 is the most negative term outlook, and 10 is the most bullish. It's reasonable to say that if the market temperature is 5, your total exposure could be 50% long.

Short-term Trend 1 to 3 weeks (6.5/10)

***Please note that the short-term temperature can change at any moment, and I have the least confidence in this time frame.**

Intermediate-term Trend 4 weeks to 5 months (7.5/10)

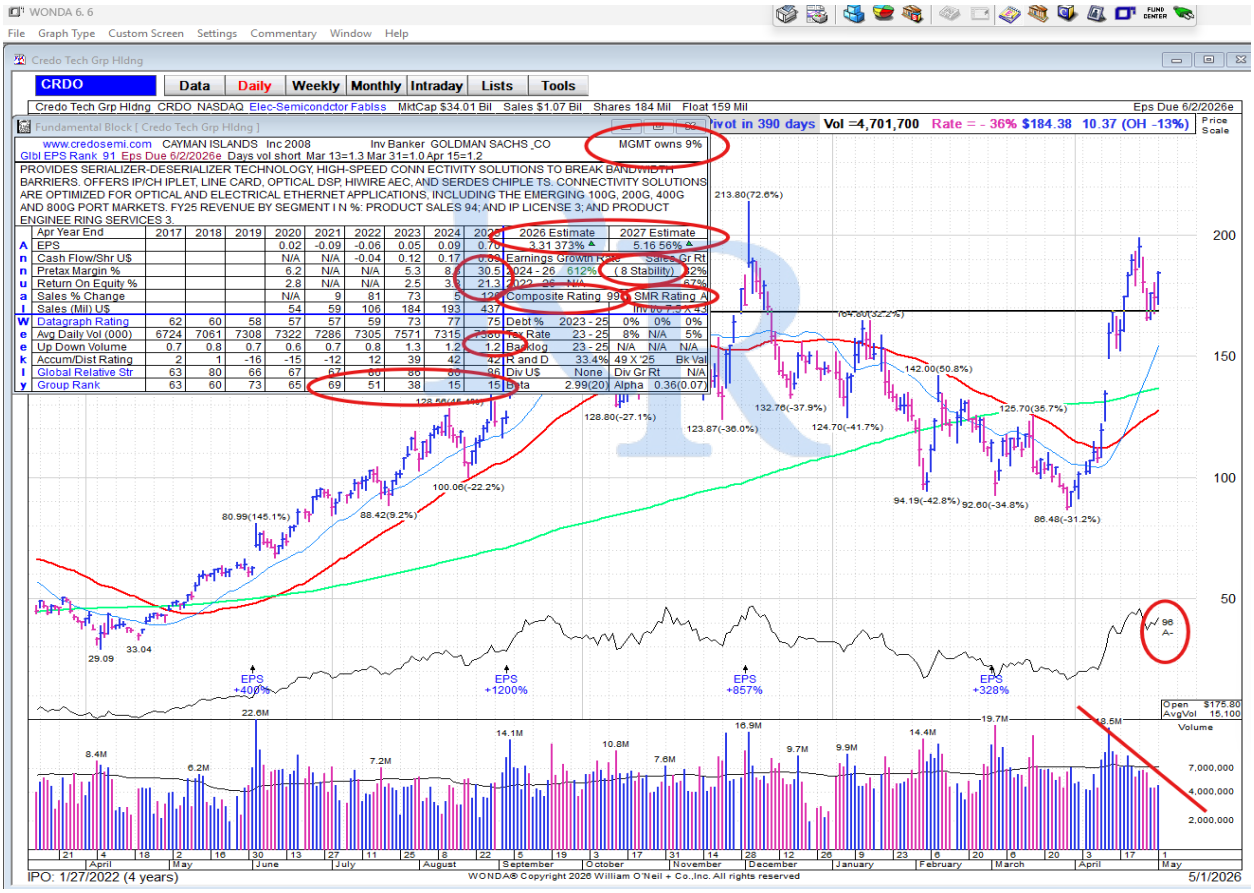

Long-term Trend 6+ month Trend is up: Bullish (10/10)

Because sentiment and many measures became deeply oversold in April of 2025, to levels signaling panic selling. Conditions like the market is experiencing almost always result in significantly higher prices in 12 to 18 months. We remain in a Raging AI-driven, disruptive tech Boom that may be turbocharged by a new pro-growth President. This is a very potent cocktail of technical and fundamental variables that historically give birth to new bull markets that can rise 100% and spawn dozens of new leaders that rise hundreds of percent, very much like 2024, except longer in duration, when not sidetracked by unforeseen black swan asteroids.

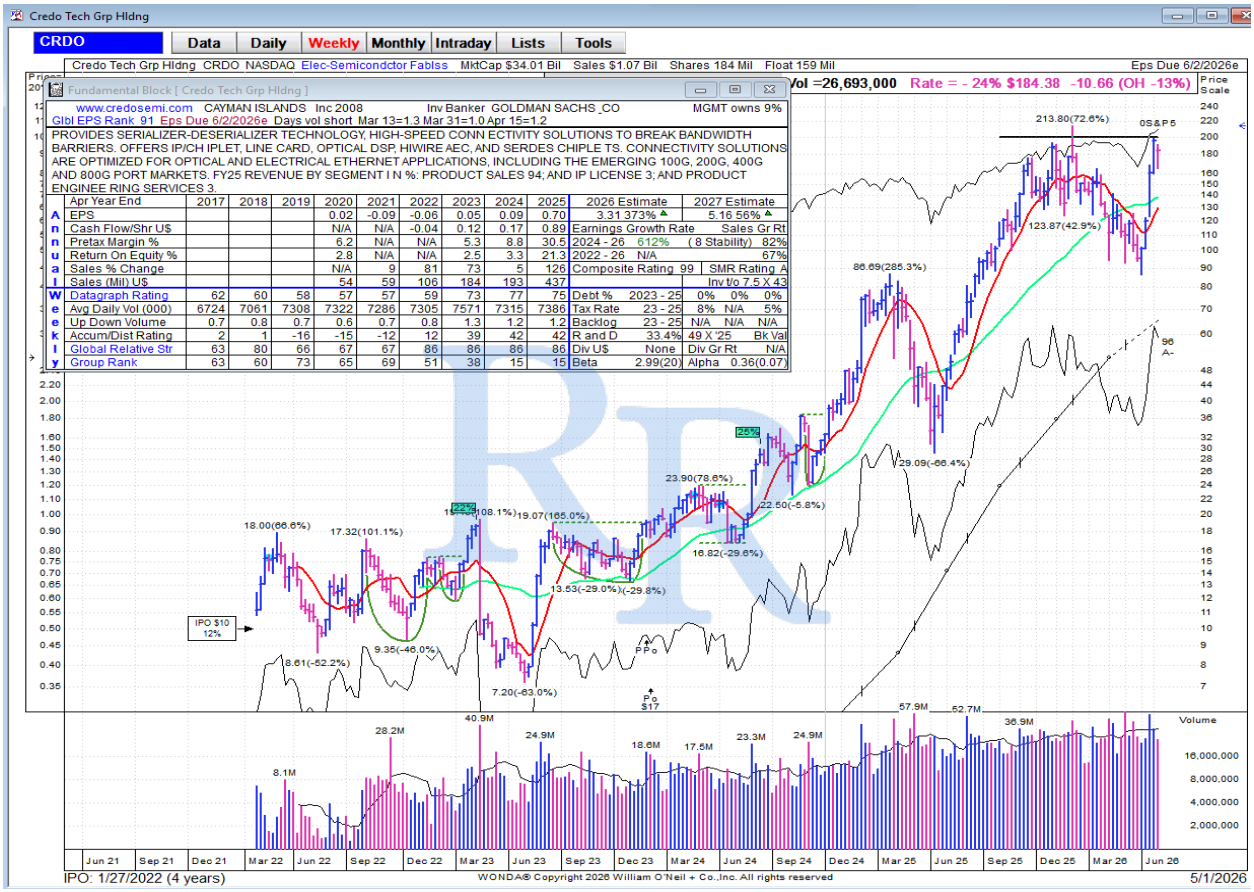

Regardless of what the market does in the next few months, I am very confident that it will be significantly higher in 12 to 18 months!!!!!!!!!!!!!!!!!!!!!! I can't believe we are going to get another opportunity to perform like 2024!!!!!!!!!!

▼ Best Actionable Ideas

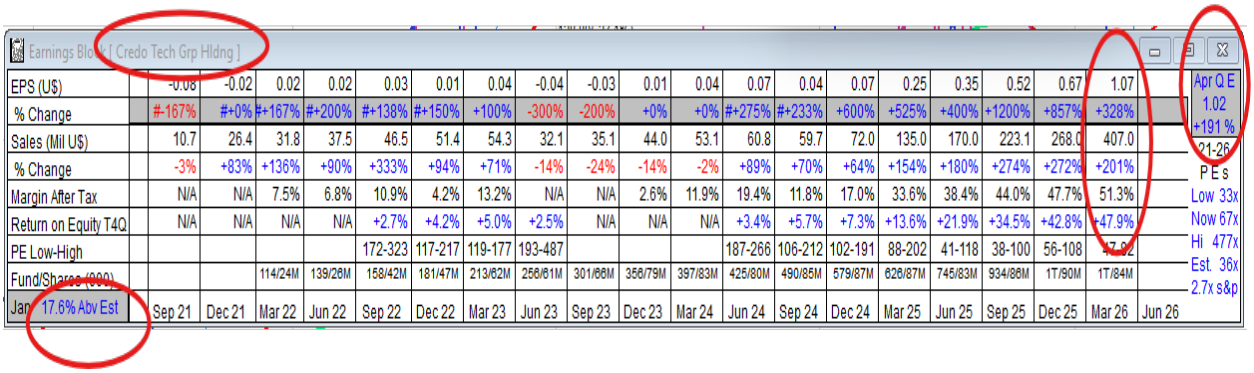

This list is only to be utilized when the Market is in an uptrend. Ideas are only actionable at or above pivot points on significant increases in volume.

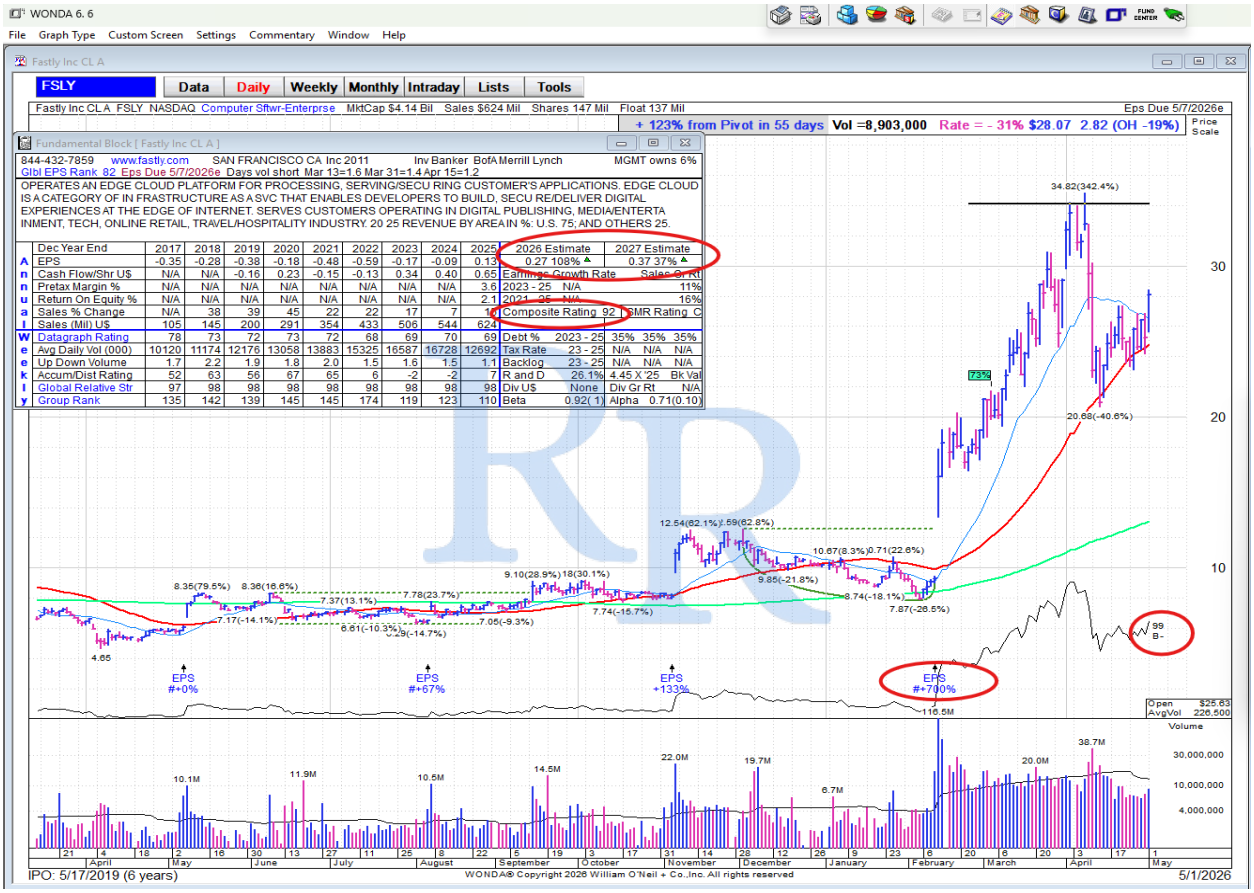

CRDO is well known to RR subscribers, as many of us killed it on CRDO in 2025. But then it broke below the "Guardrail," the 50 Day Simple Moving Average = DSMA, and collapsed -60%. I had written it off as dead, but the recent acquisition has breathed new life into this past beastly TML. I guess the insiders who own 9% of the shares weren't ready to give up. Note the volume has been drying up over the last five days. Pivot over the Livermore large number $200.00.

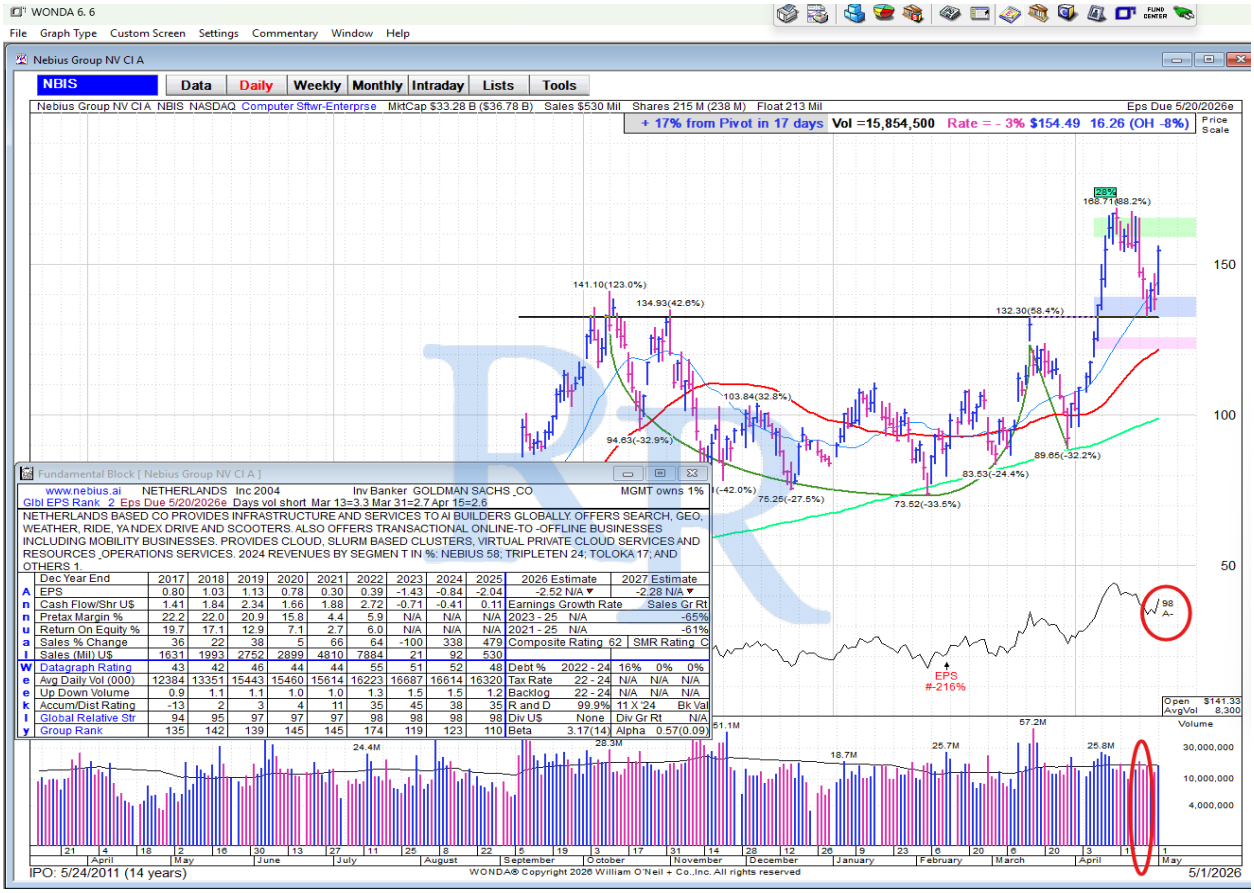

CRDO Weekly had a nice high close last week and a bullish volume character change.

CRDO: Triple-digit sales, earnings, and estimates rock my world!!!!!!!!!!!!!!!!!!

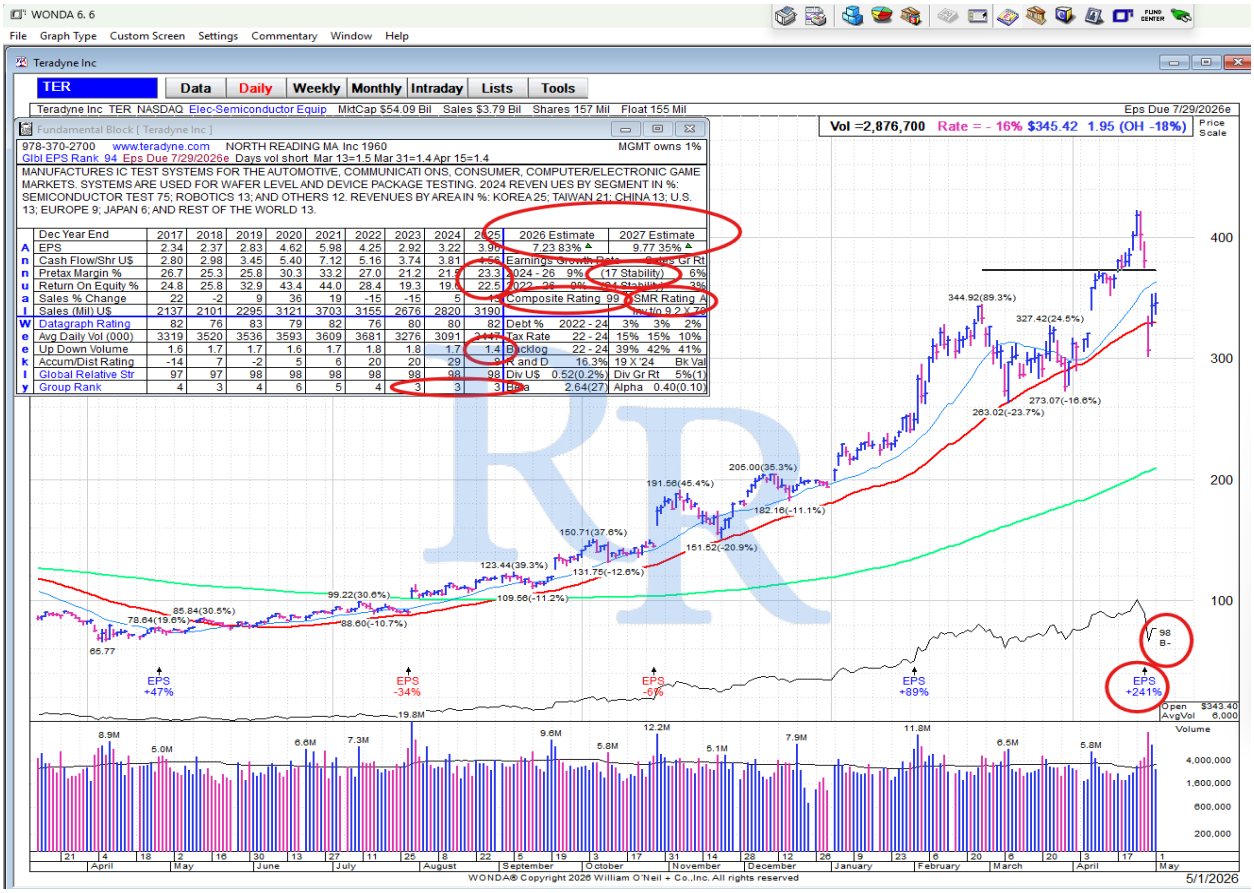

FSLY is an edge computing play, and it's becoming a hot topic. The pattern may be developing into a spoiled bear flag. I rarely have a small-cap in the "best idea" section. It's risky, encroaching on a cowboy idea, but this week's earnings can change everything. A massive gap-up earnings response could get me to pile in. Caution!!

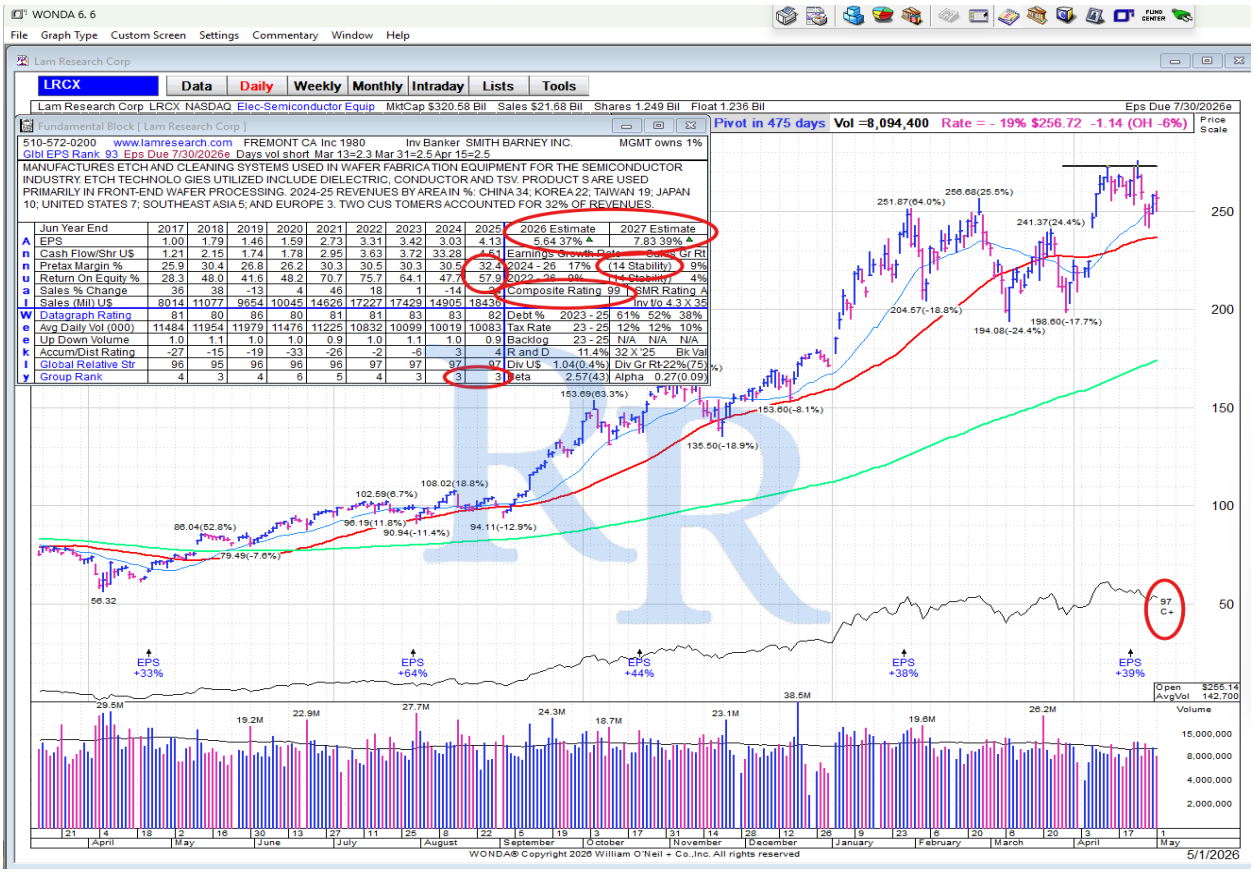

NBIS: What kept me chill last week, as it dove down from $169.00 to $133.00, was that the volume did not pick up and was lower than when it rose from $90.00 up to $169.00. The sellers did not act with authority. The break was abrasive and may be due to a lack of earnings. I added last Friday. Pivot into new highs.

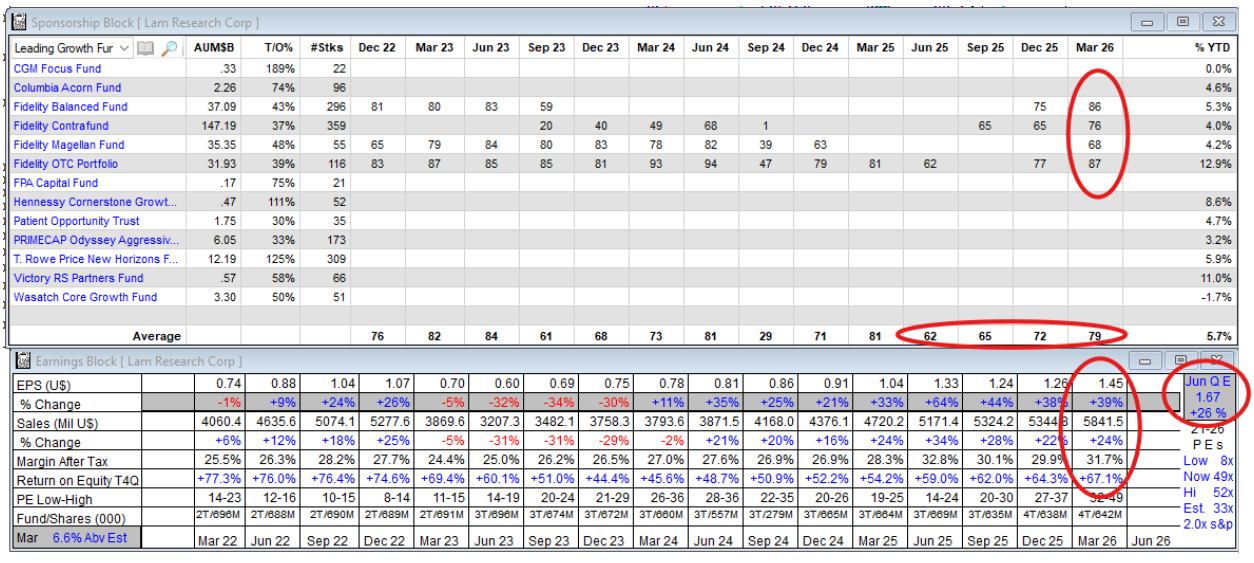

Client or proprietary accounts hold this position.

TER shook me out last Wednesday and damaged a great week for me. To add insult to injury, TER flashed a shakeout plus three buy on Thursday!!!! $300.00 low X10% = $330.00 shakeout +3 or 10% O'Neil buy. Bill would also say that because of the expectation breaker exhibiting unique strength, he would add an additional +15% more shares. TER dove on weak forward guidance, but it remains a 98RS, 99 Comp name. It really has spectacular metrics and fundamentals. If investing were easy, everyone would be rich.

LRCX lacks the jet fuel of some of the beasts in this report, but LRCX has VRT 99Comp quality that institutions and conservative growth investors love. Pivot over $174-$176ish.

LRCX = Quality approved by institutions.

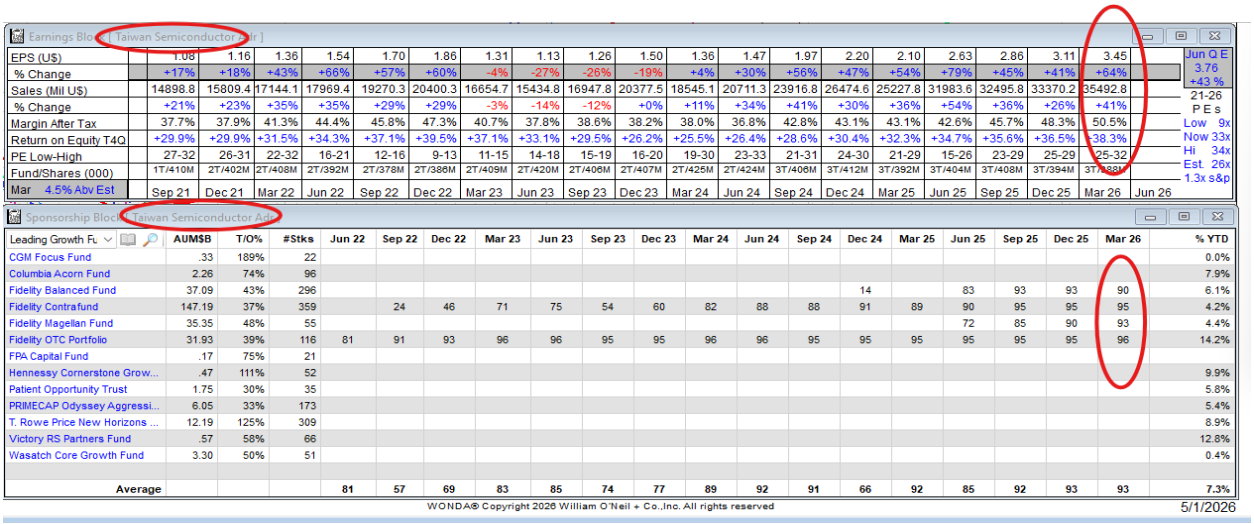

MRVL is sporting short Two Weeks Tight (2WT) and seven-week Wall Of Blue Volume Accumulation (WOBVA). There were a lot of SOBVA clues that MRVL was going to become a liquid Monster. 97RS. 99 Comp, #23 stability quality.

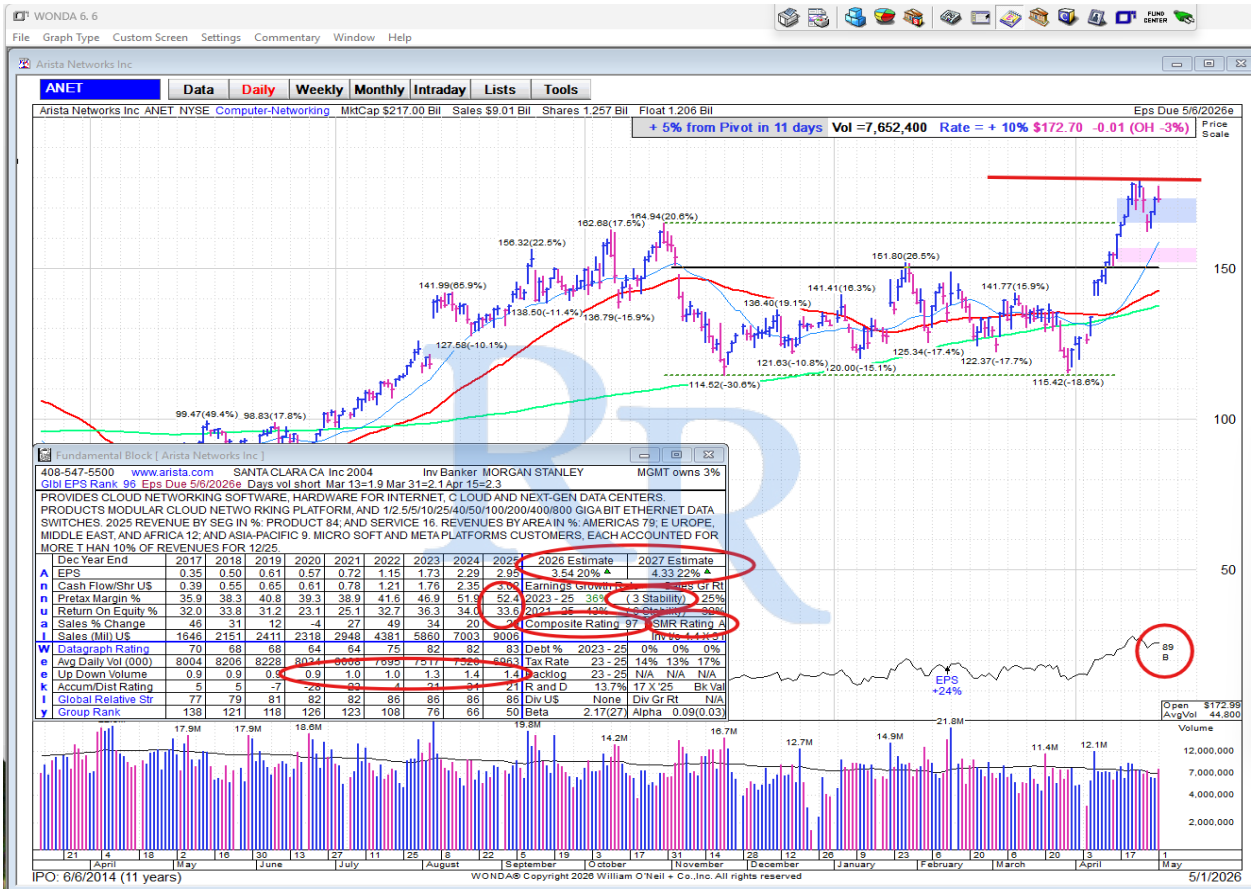

Client or proprietary accounts hold this position.

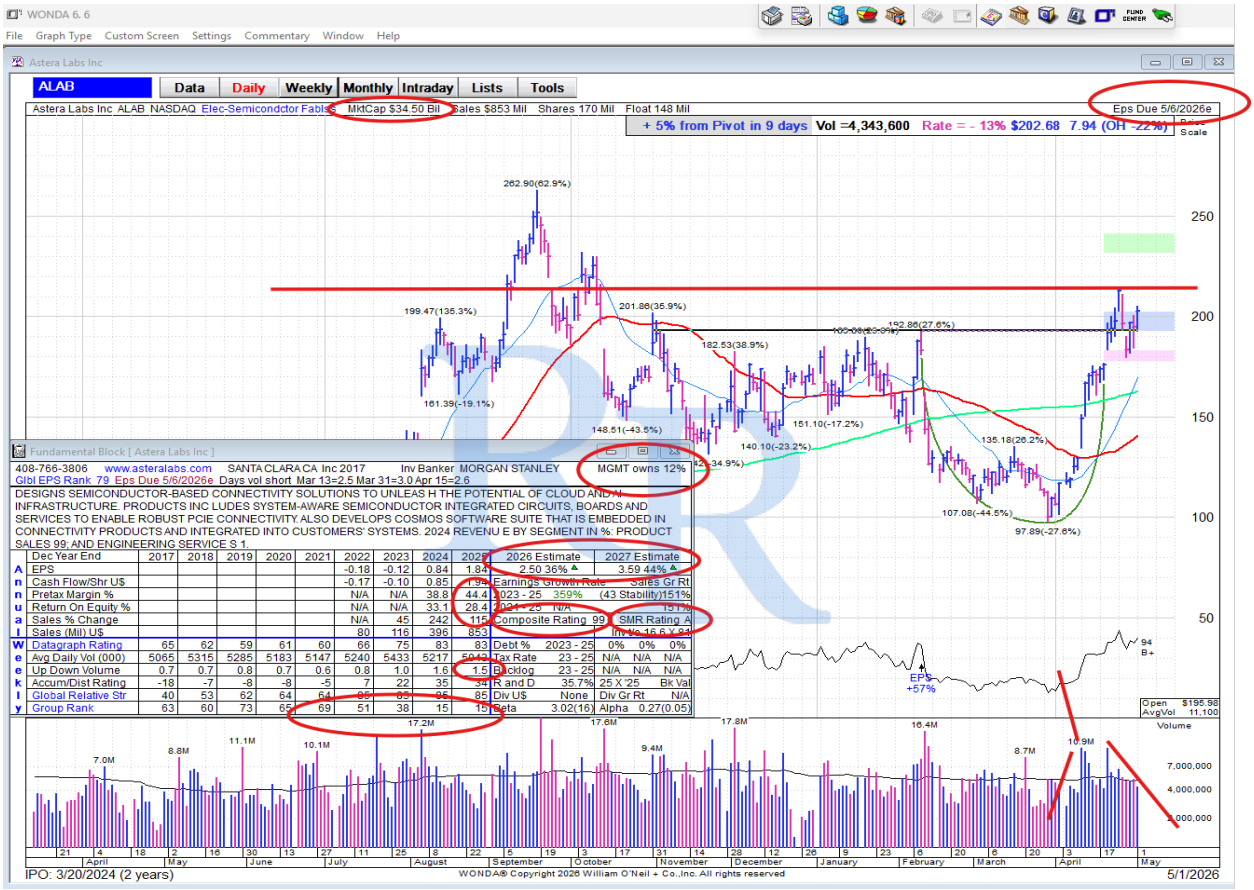

TSM: Screams TML, it reflects nearly perfect technical and fundamental metrics. Super fat margins with #14 stability would get Bill's approval. It's a tiny bit extended, but positions could be started or added to right here.

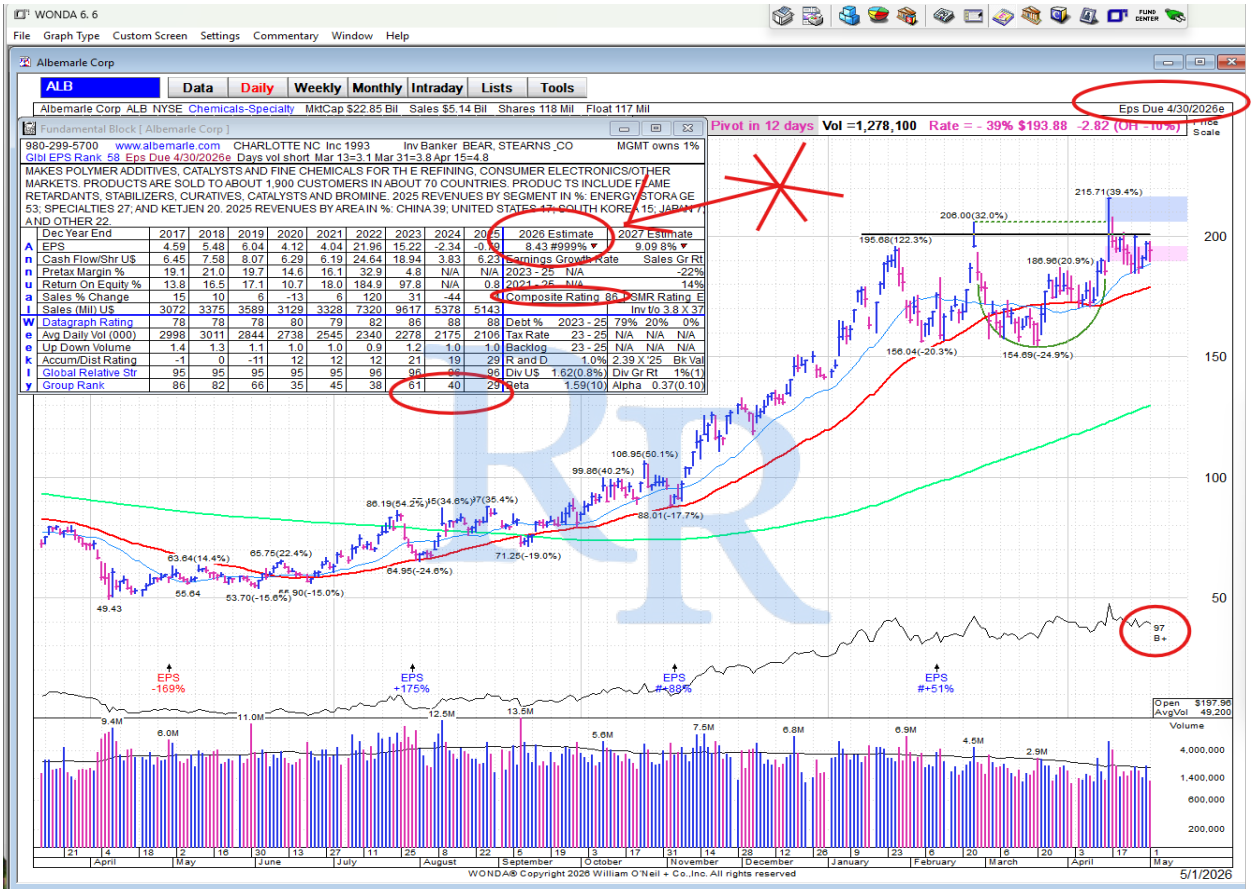

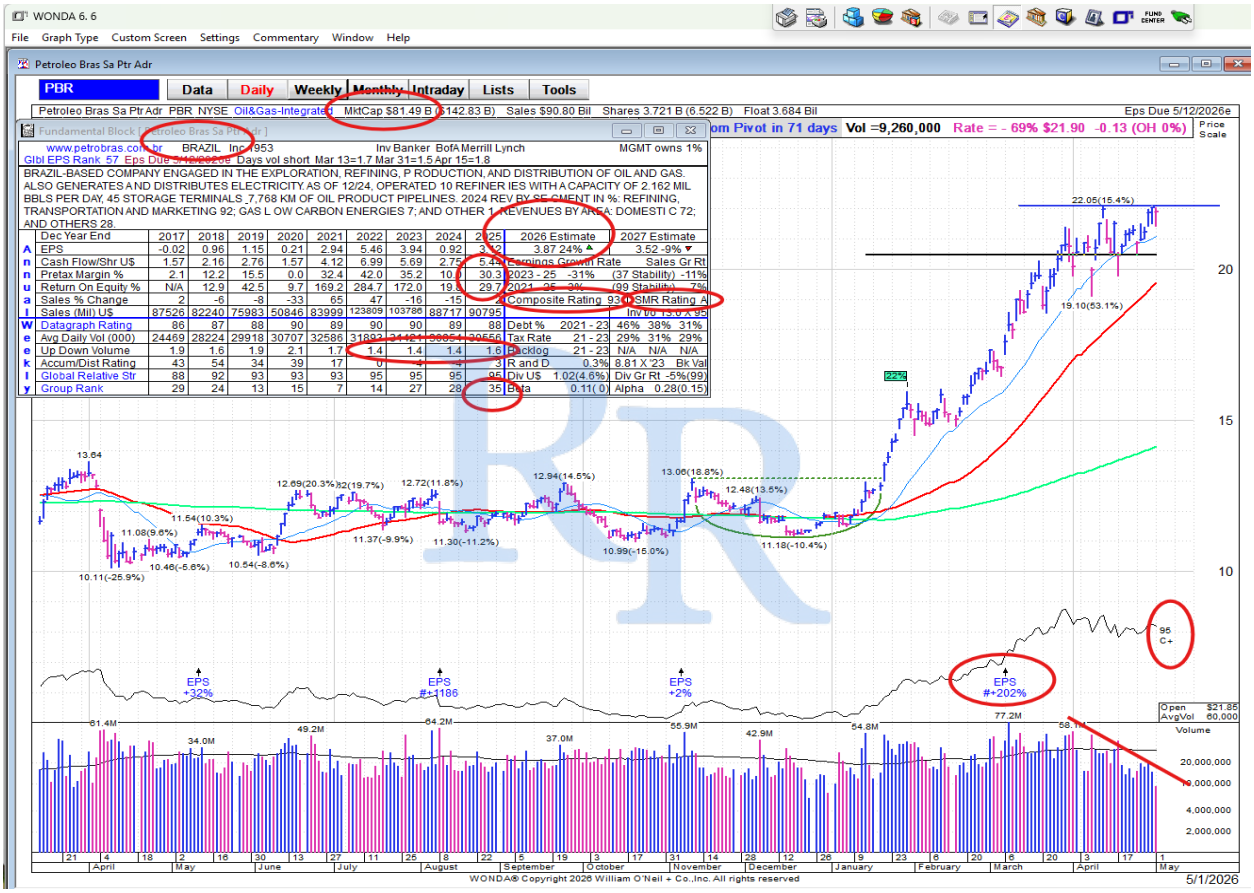

ANET is very much like TSM. Mini pivot, best for 10% adds, over $180.00.

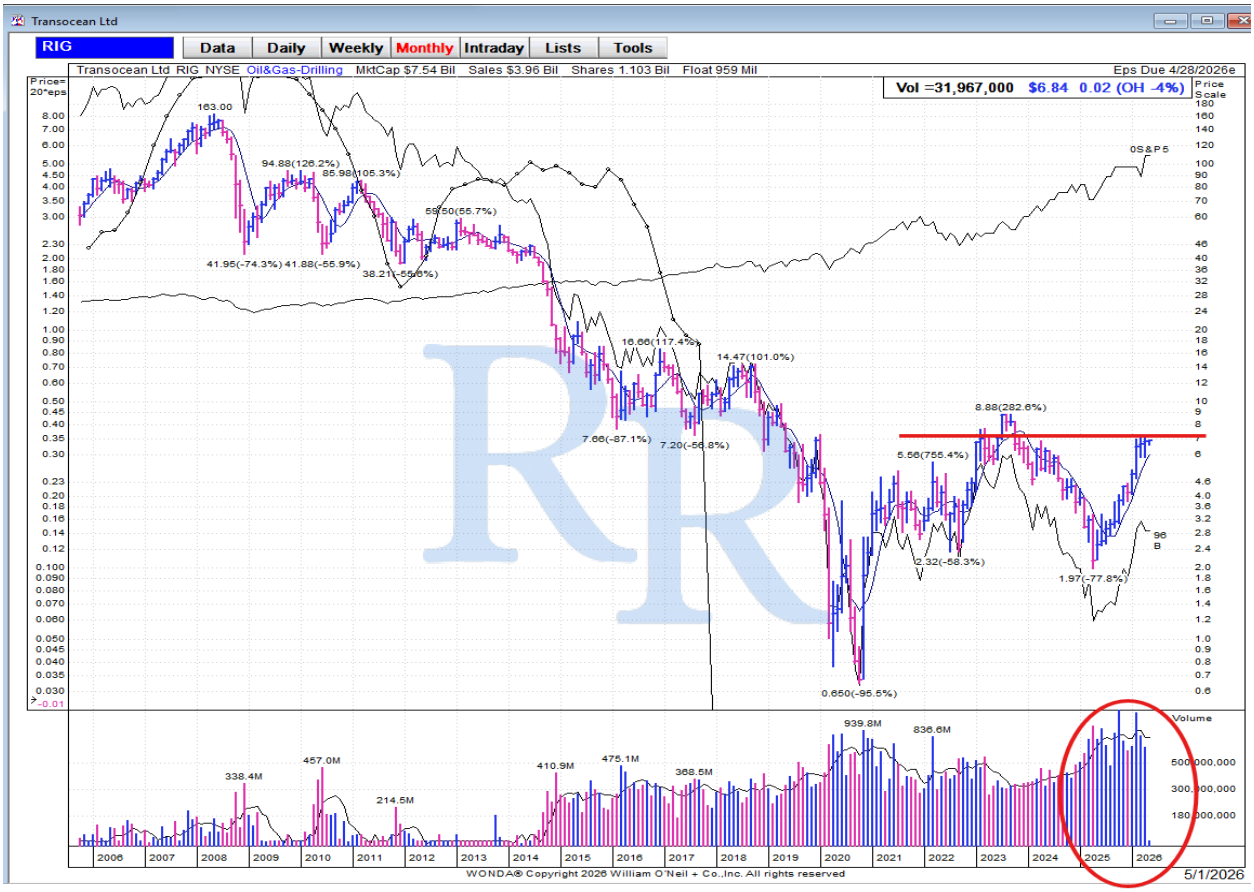

ALAB is a lot like CRDO, but the base is a little looser. I guess not all past leaders remain dead forever, actually, only 7% of past TML's ever recover for a second act. I did the historical research. Management owns 12%, #15 group, 99Comp, 1.5U/D, earnings are due Tuesday; Fireworks are likely. Pivot over $214.50.

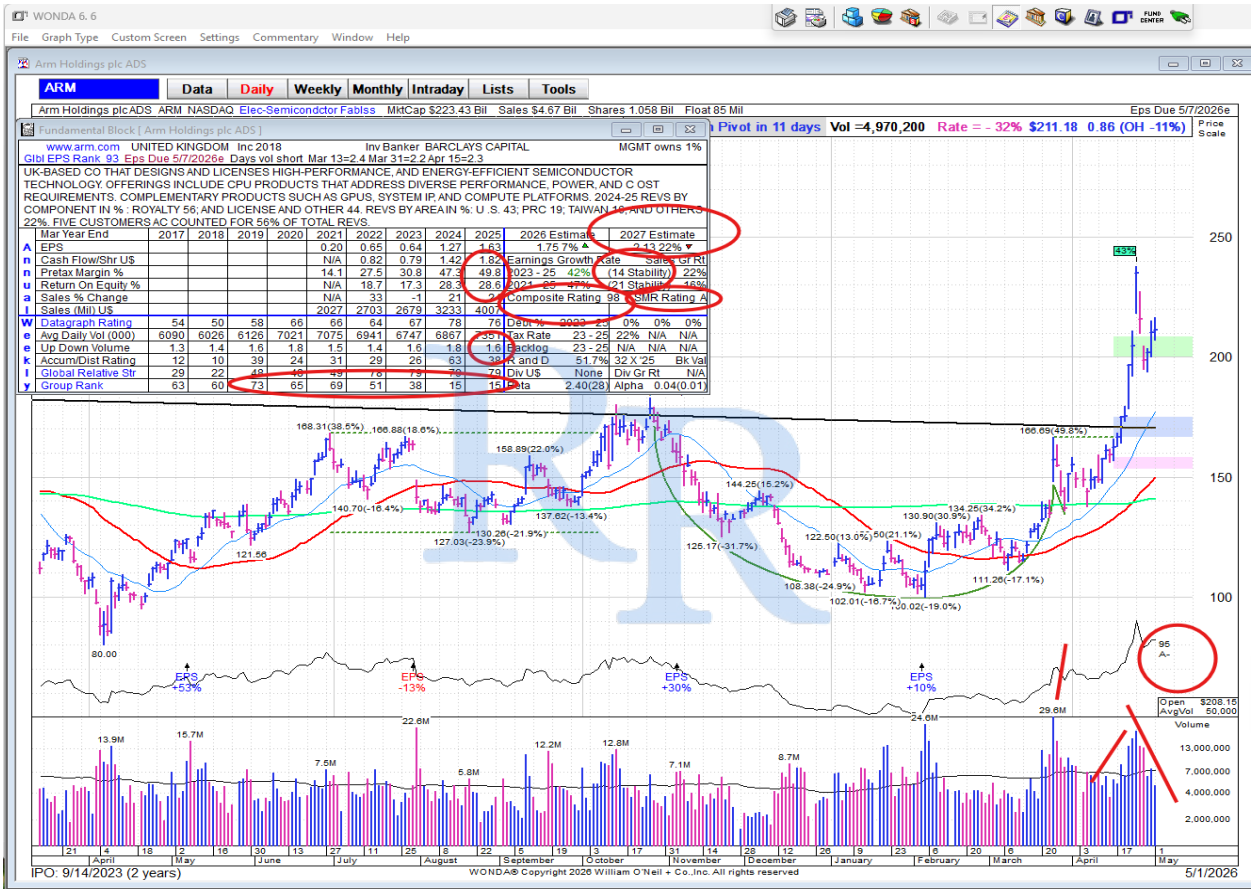

ALB: Don't be shocked if it bursts higher on earnings, MASSIVE EPS estimate. SQM, as well.

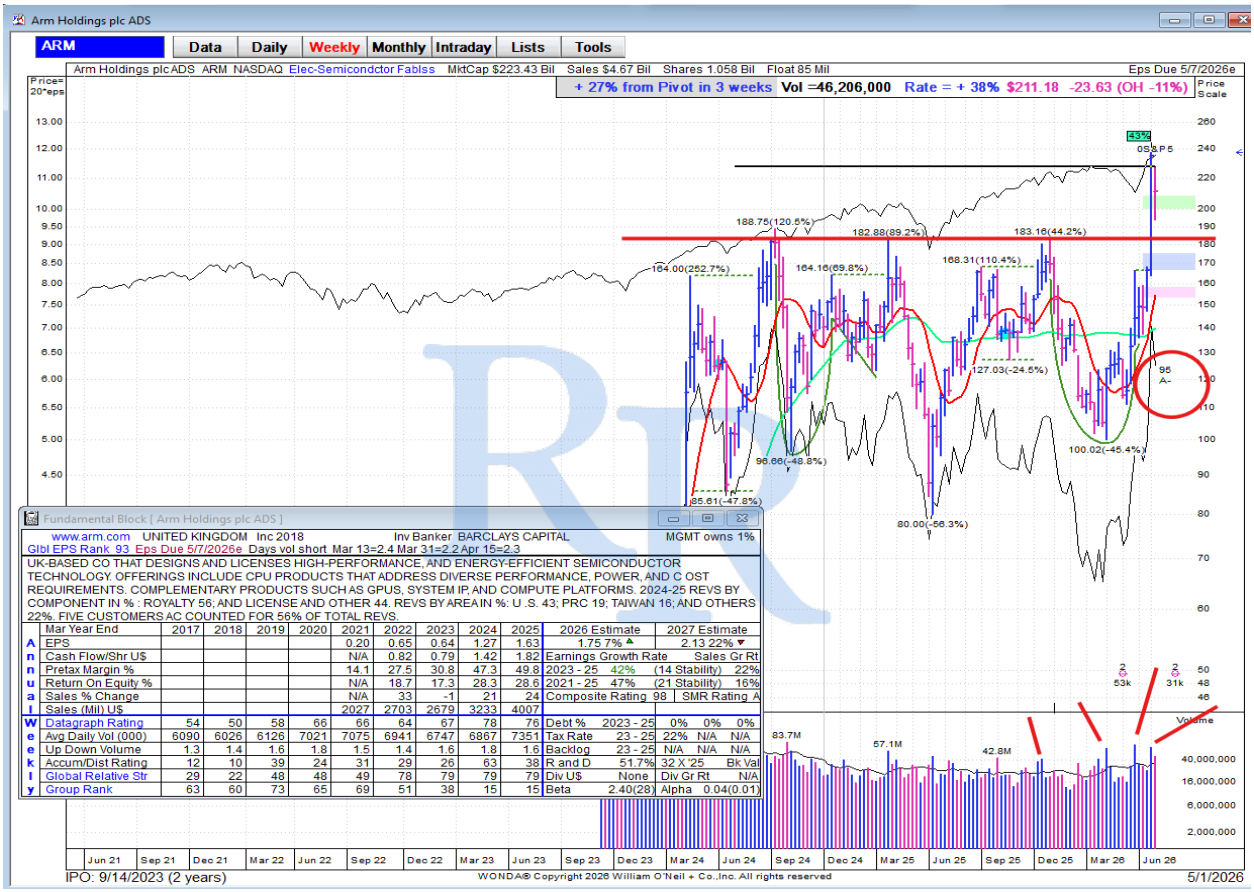

PBR is the O&G TML with the Brazil factor. Base in progress. EIS is the best ETF that represents this group.

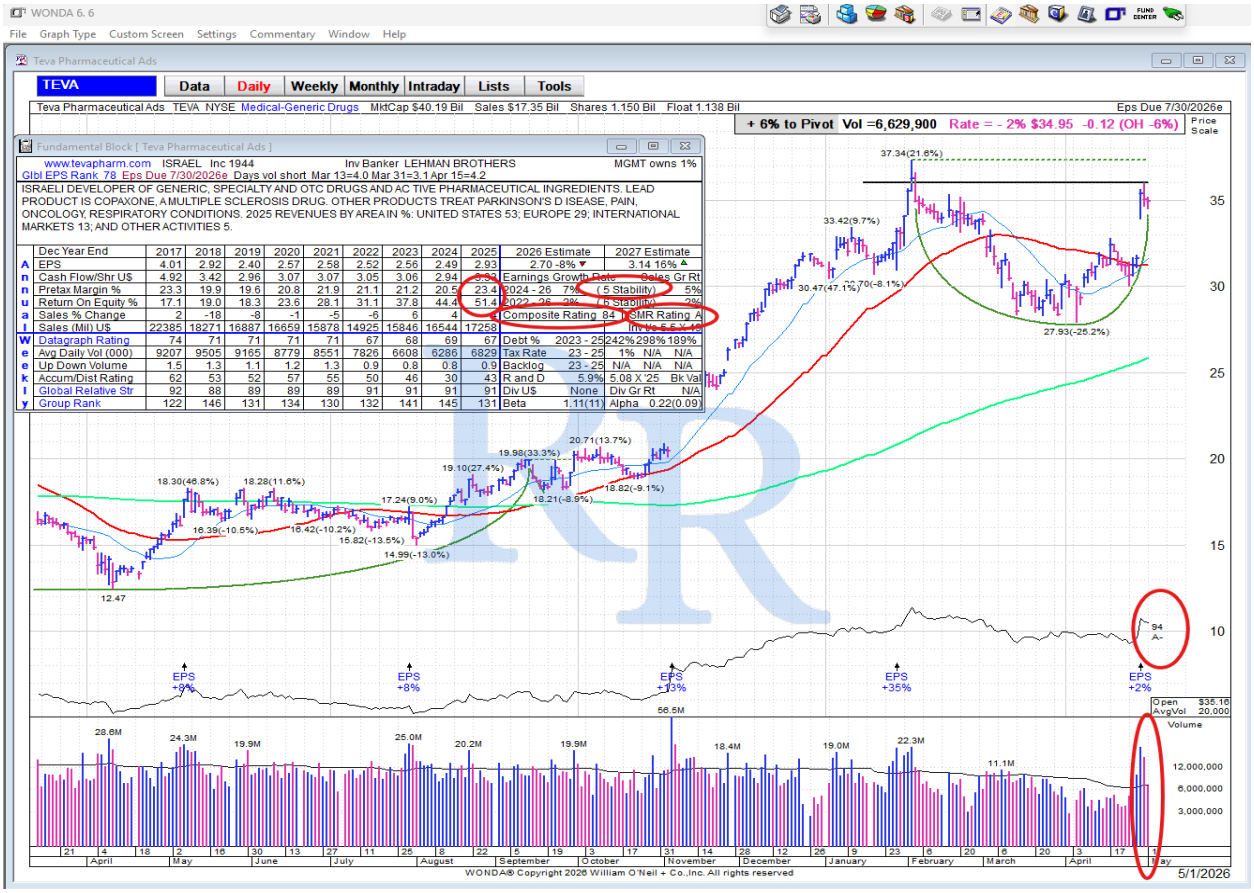

RIG: Amazing, renewed interest in this O&G, #6 group, name. WOBVA and SOBVA. Sweet Cup & Handle!!!!!!!!!! Pivot is over $7.25. HAL, VLO, NE, TDW, SLB, and BKR as well.

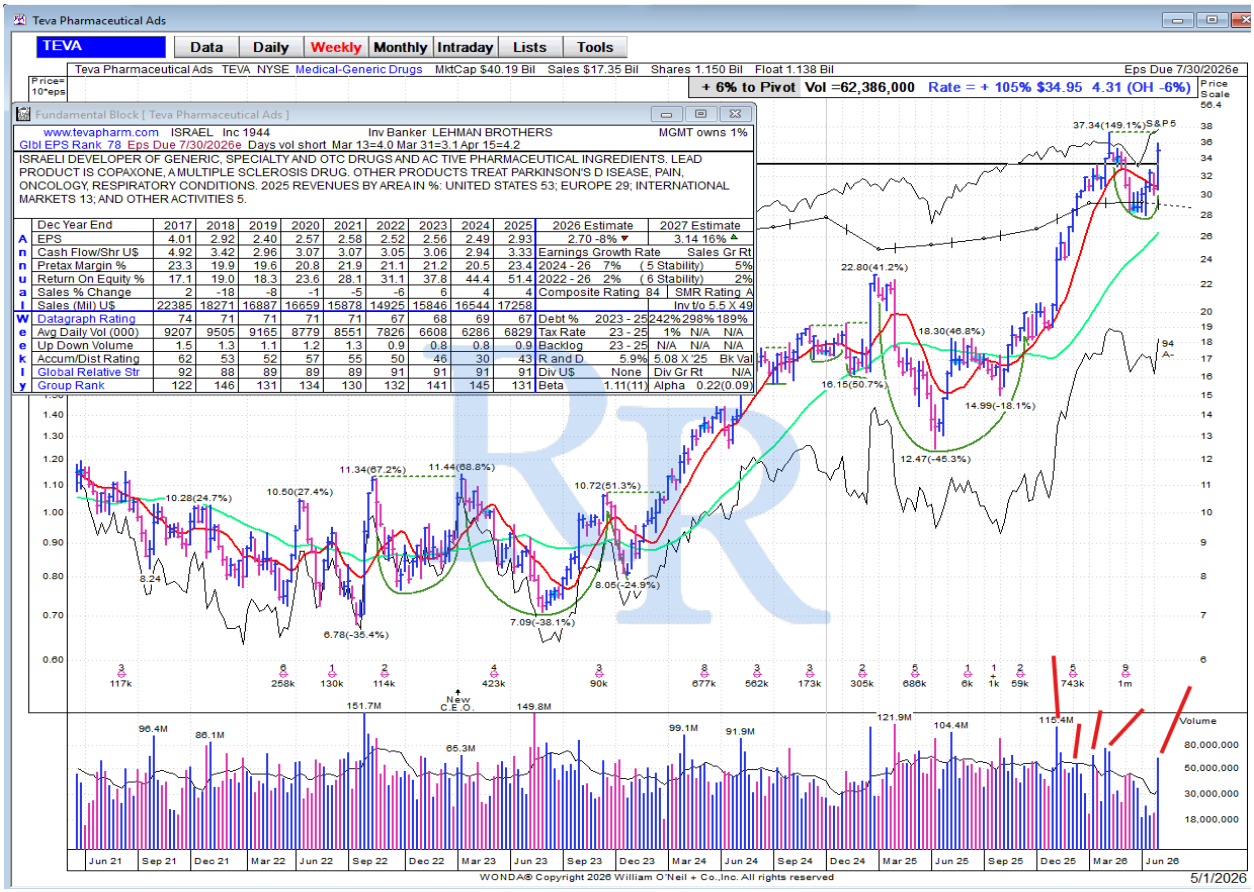

ARM: Earnings are due this Wednesday, and I am expecting fireworks. Specifically, management's comments on the timing of their semi-manufacturing plans.

ARM: There were clues in the SOBVA that it was going to break out of its excessively loose base.

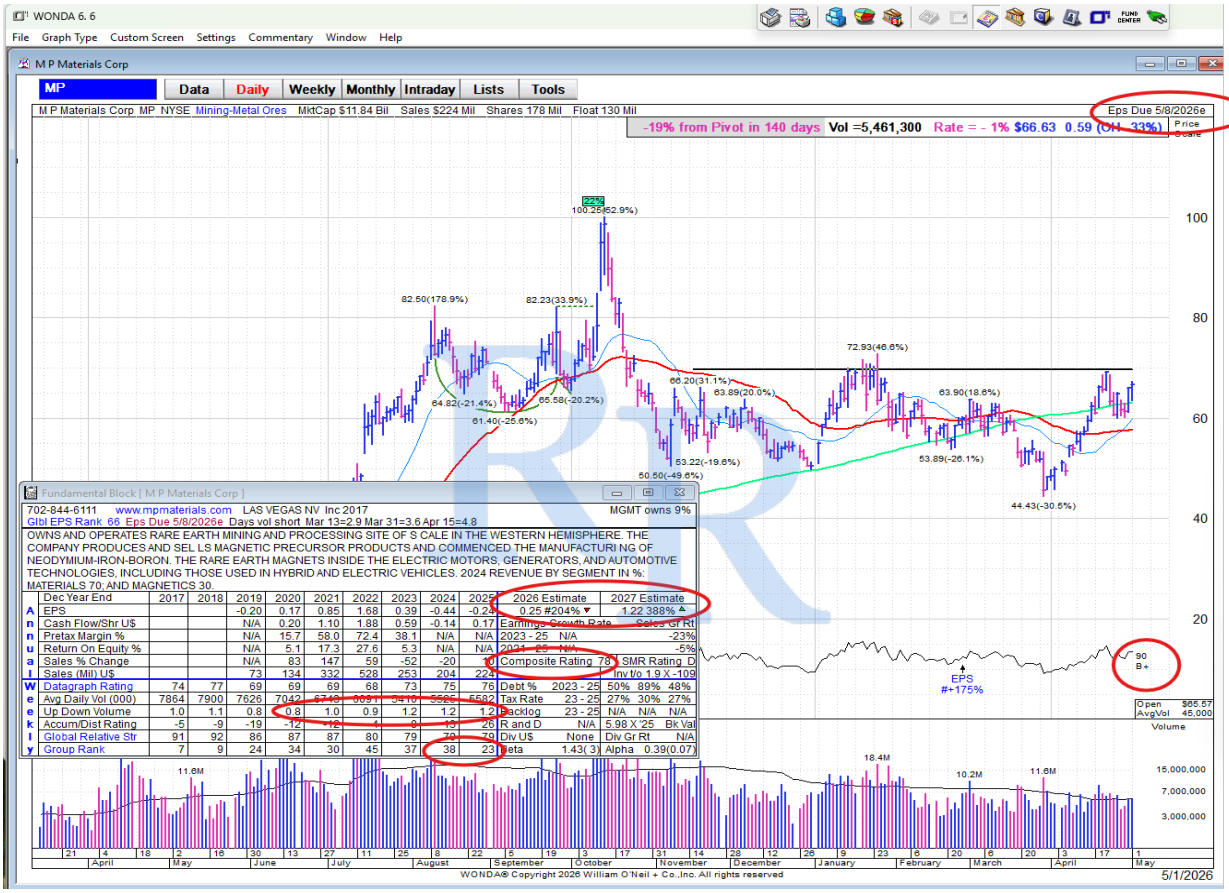

TEVA, there is a handle in progress, and Druckenmiller is in.

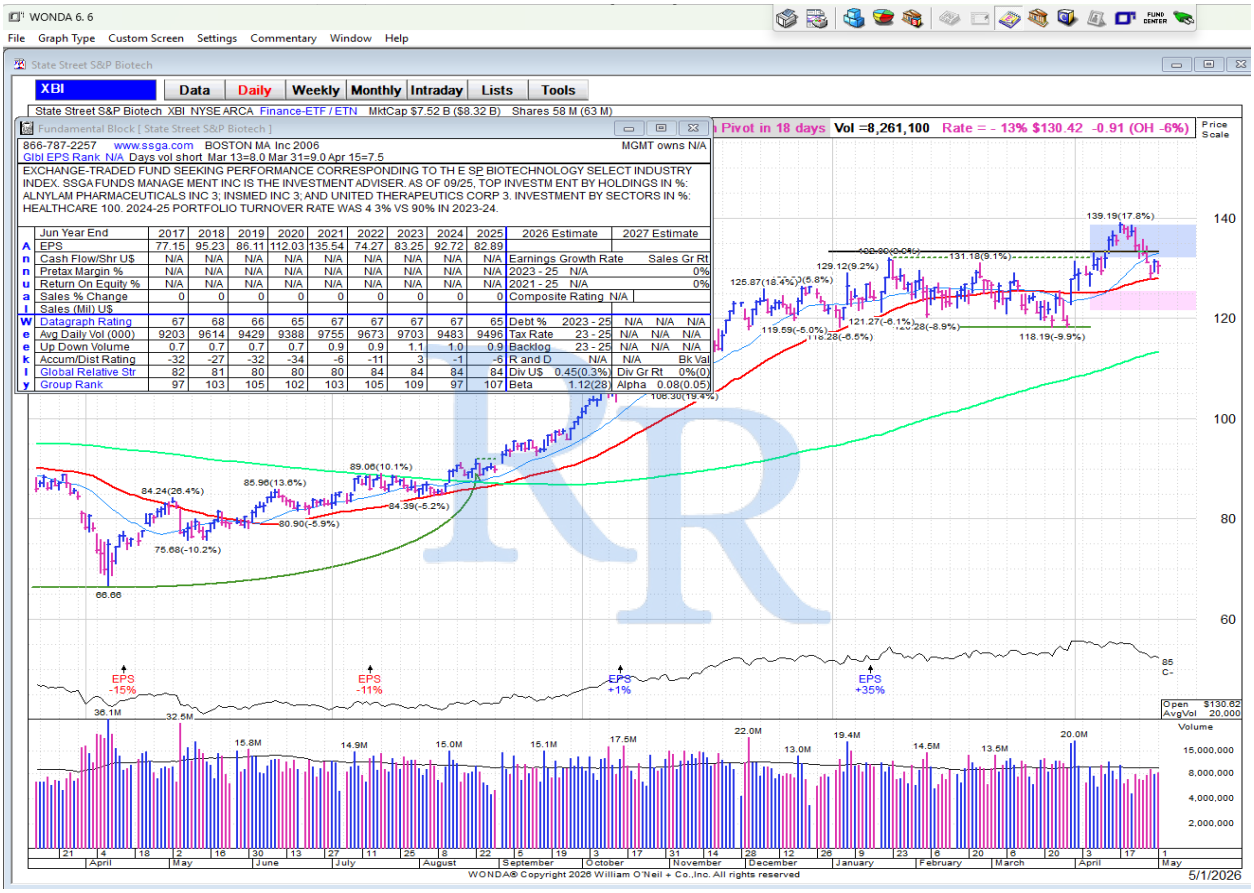

TEVA Weekly reflects heavy accumulation = SOBVA. See analyst comments below.

Teva Pharmaceutical (TEVA, BUY, PT $40) Q1: We're Tracking 10 Clinical Catalysts This Year Worth Owning TEVA Into - *This year is all about the pipeline and less about the underlying commercial biz, in our view. Through the rest of '26, we see a slew of catalysts, many of which have (+) risk/reward and are worth owning TEVA into, which is why TEVA remains our top pick. In the immediate term, expectations aren't high into TEVA's Phase IB vitiligo update (20%+ F-VASI75 is good enough) nor MRK's SSc-ILD update, which, if positive, supports TL1A going into more fibrotic diseases.*

MP: Double bottom base in this rare earth miner that the US Government has taken a strategic position in. Pivot over $70.00, 2nd pivot over $73ish.

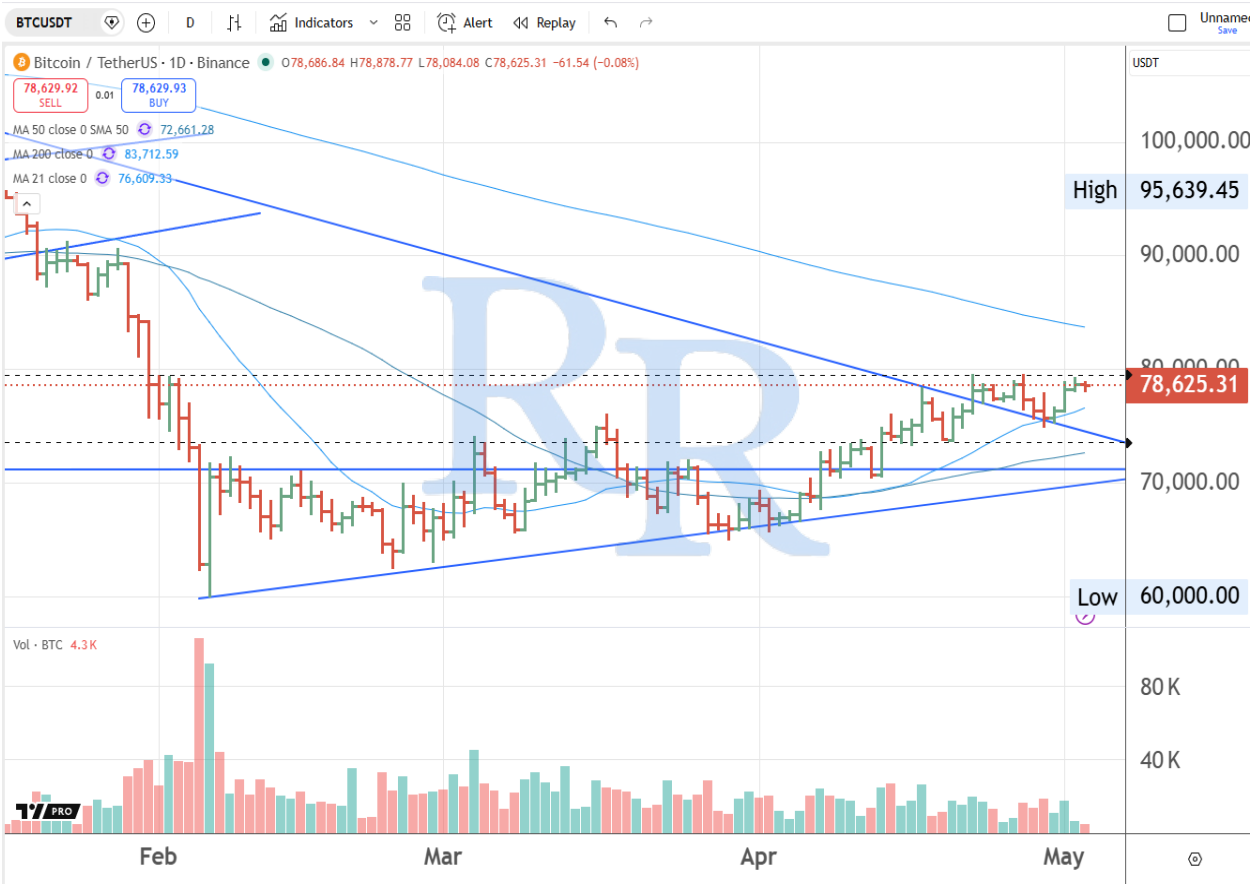

XBI: Pulling back to its 50SMA is a great place to add or build a position.

Client or proprietary accounts hold this position.

Biotechnology – FDA Launches Real-Time Clinical Trial Monitoring to Expedite Drug Development - *The FDA is introducing real-time clinical trials (RTCT) to allow sponsors to report efficacy/safety data ("signals") to the agency in real time, potentially shortening drug development timelines and accelerating FDA decision-making. Notably, the FDA is completing pilot selections by Aug 2026, meaning RTCT is not a simple ideology or framework. We think earlier-stage programs for indications with clear, objective measures could be best positioned.*

▼ Crypto

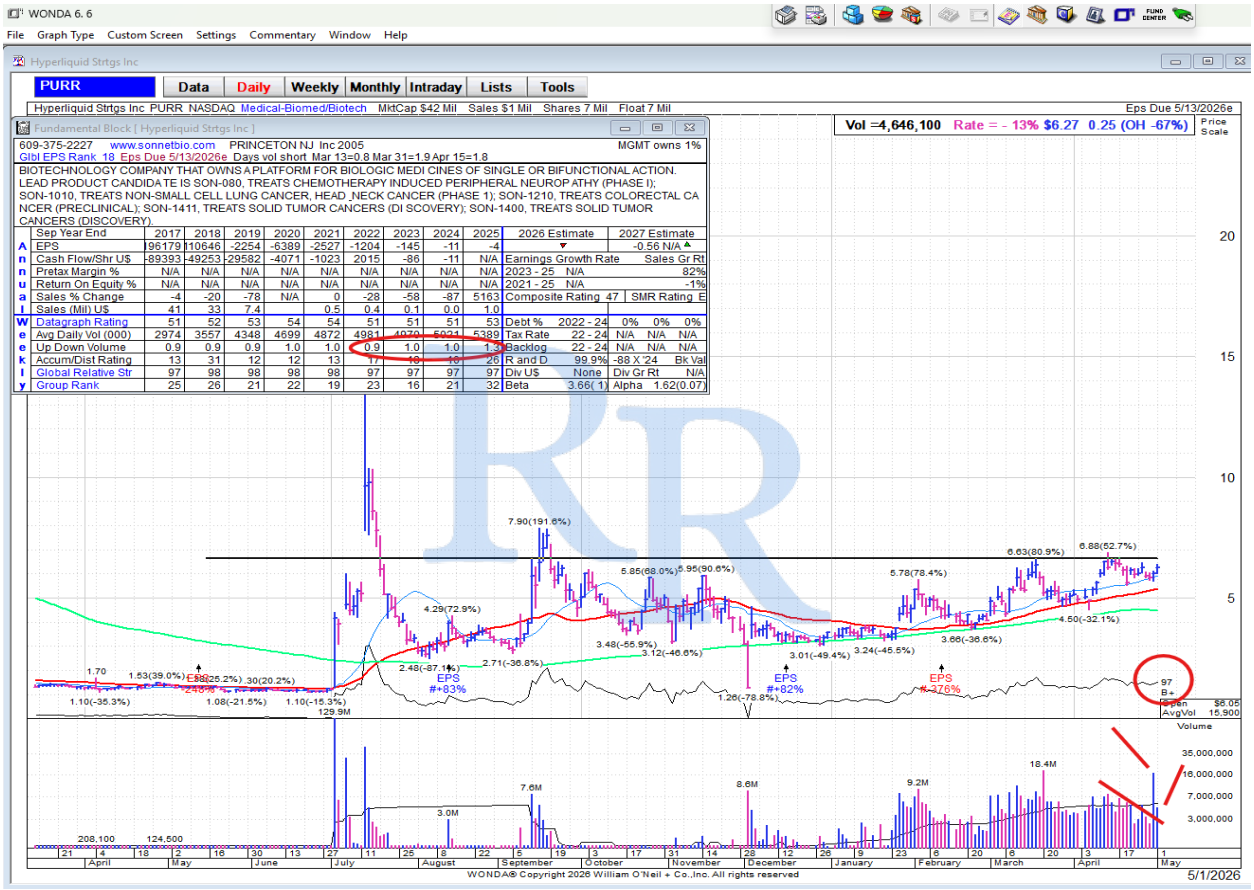

BTC now has a 13-day digestion with a $79,600 pivot. The digestion is very shallow, and it looks so tranquil. I will evaluate any breakout by its violence. The trend has been up since February, which should make me more bullish, but I will wait for a breakout to flash an all-clear signal.

Client or proprietary accounts hold this position.

ETH has a more constructive 17-day, downward-sloping digestion vs BTC. Pivot over $2,470.

Client or proprietary accounts hold this position.

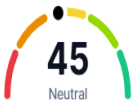

PURR: The long handle with volume drying up encourages me. Pivot over $7ish.

Five Charts That Scream "We Are Not There Yet"

BY THE MARKET EAR

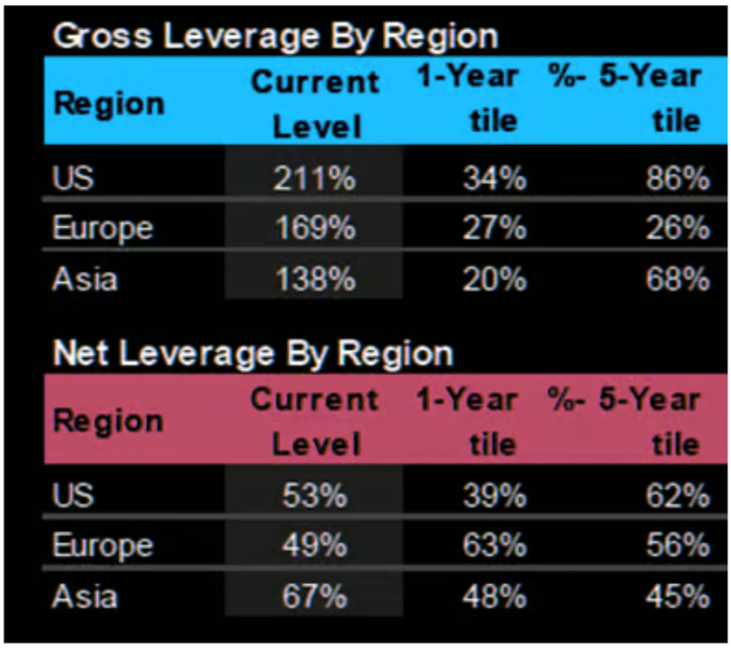

SATURDAY, MAY 02, 2026 - 9:13

The data that complicates the short case

ATHs. A face-ripping April. Even a textbook "shooting star." If you're looking for reasons to short, the setup feels irresistible. But here's the problem: positioning says you're early. Way too early. From Morgan Stanley to Goldman to JPM, fast money isn't max long, it's barely engaged. Gross and net leverage are subdued, tech just saw one of the biggest de-grossings in a decade, and even the "crowded" semis trade isn't extreme.

MS data on overall HF exposures

The 1-year percentile numbers look pretty conservative right now across the board. 34th percentile for US gross - have not seen that in a while.

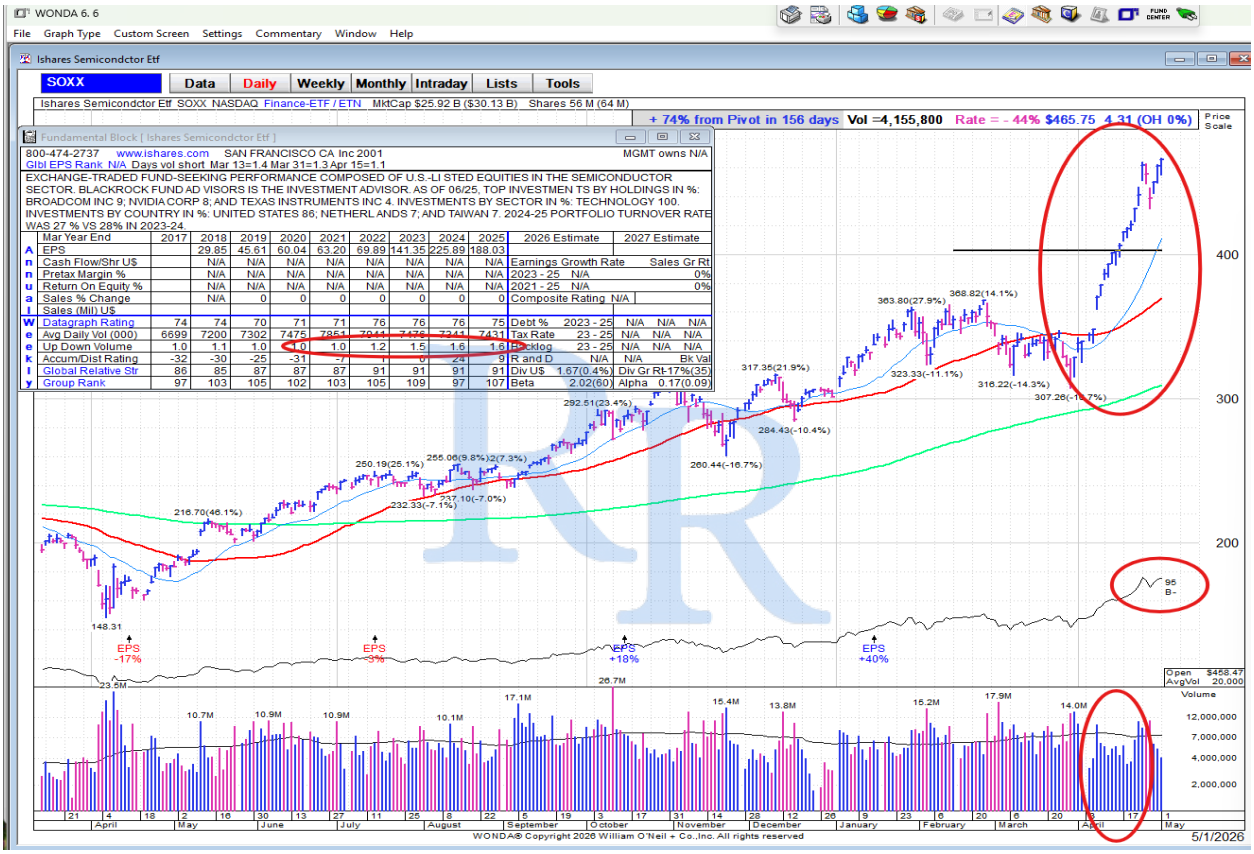

Gross Leverage By Region

Region	Current Level	1-Year %-tile	5-Year %-tile
US	211%	34%	86%
Europe	169%	27%	26%
Asia	138%	20%	68%

Net Leverage By Region

Region	Current Level	1-Year %-tile	5-Year %-tile
US	53%	39%	62%
Europe	49%	63%	56%
Asia	67%	48%	45%

There is $7.6 TRILLION in money markets, which is an all-time record high on both absolute and relative terms.

SOXX perfectly exemplifies the unprecedented historic power of the current rally. 18 days in a row, up, Wall of Blue Volume Accumulation = WOBVA, and 21 of 23 days in a row UP. A +50% rally in an index in 23 days!!!!!! I have been saying it for over a year: "With the greatest innovation in human history gaining traction, we should expect the greatest bull market in history." It's been so powerful; it even exceeded my uber-bullish expectations. Last week was crazy; after 18 days in a row up, all the bears could come up with was two days down, then straight up into new highs. This is the definition of a lockout rally. Few believe it, especially large hedge funds. See the article just below. Nearly everyone, including me, is begging for a digestion to increase exposure, but we continue to be locked out and afraid to buy extended. If digestion doesn't occur by mid-June, the odds of a historic ramp into quarter-end increase dramatically. Most fund managers have been left in the dust.

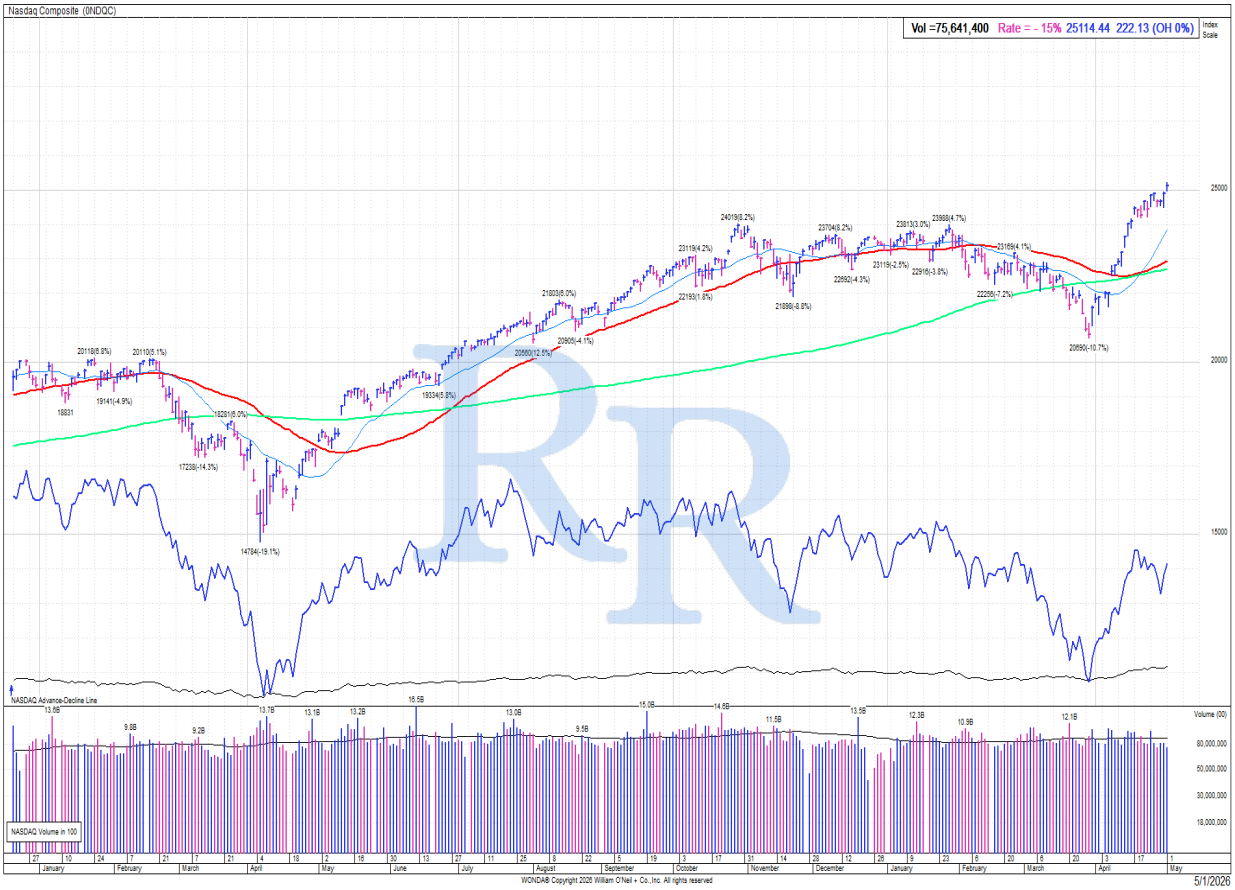

The good news is, after a five-month digestion in the indexes, the last four-week rally is likely to be the beginning of a rally, not the end. I expect higher prices into mid-December and leaders trading at 2 to 5X the indexes. It's on like "Donkey Kong."

Investors are betting on a prolonged boom for memory chipmakers amid voracious AI demand that has prompted customers to lock in multiyear contracts with SK Hynix and Samsung Electronics. Hynix, the world's second-largest memory chipmaker and a key supplier to Nvidia, said the "structural shift" differs from past booms because customers are prioritising security of supplies over price amid an acute shortage. That shift is reinforcing expectations that an industry long defined by boom-and-bust cycles may be shaking off its volatile past. Analysts say the memory sector is facing a supply crunch as chipmakers, which also include Micron Technology, struggle to meet demand driven by a global data centre build-out, making memory a key bottleneck in the AI supply chain. Many view the shortage as structural rather than temporary because demand has shifted from cyclical consumer electronics to deep-pocketed AI hyperscalers rapidly increasing capital spending. Demand is also becoming more persistent as AI spreads into everyday applications, increasing the need for memory across devices and services. Samsung's co-chief executive Young Hyun Jun told shareholders in March that AI demand was driving an "unprecedented supercycle" in the semiconductor market and the company is planning a "substantial" increase in capital expenditure this year to meet surging memory demand.

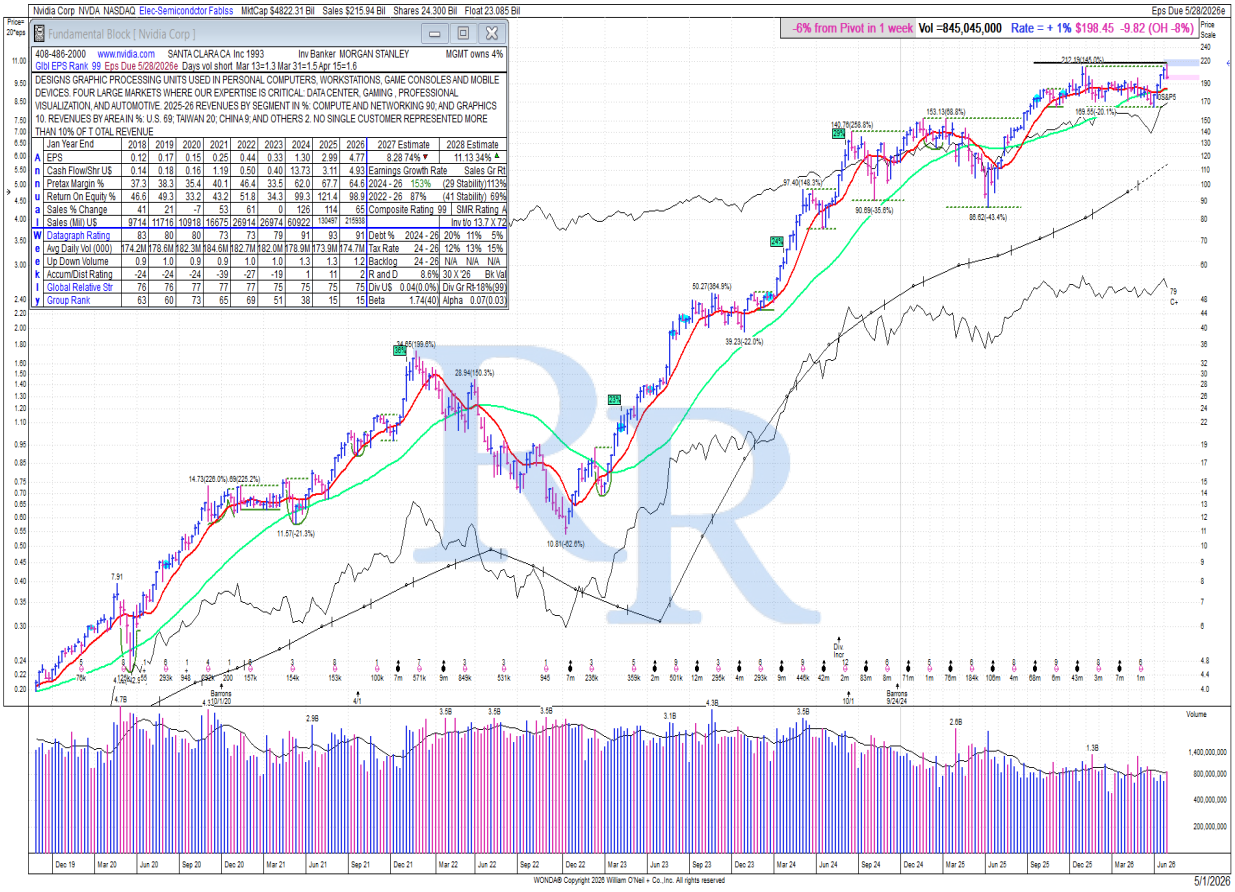

"We are in a supercycle as AI requires more powerful memory for inference and agentic services," said Kwon Seok-joon, a professor at Sungkyunkwan University. AI inference is the process whereby a trained AI model such as a chatbot generates responses. Agentic AI services are advanced systems that can handle complex problems and act on their own, with little human assistance.

NASDAQ: After a three-day digestion last week, the index rocketed into new highs when many thought Friday would bring a selloff in anticipation of deteriorating conditions in Iran. That is a bullish expectation breaker. NASDAQ A/D is now B+. The market is sending us an historic Bullish signal.

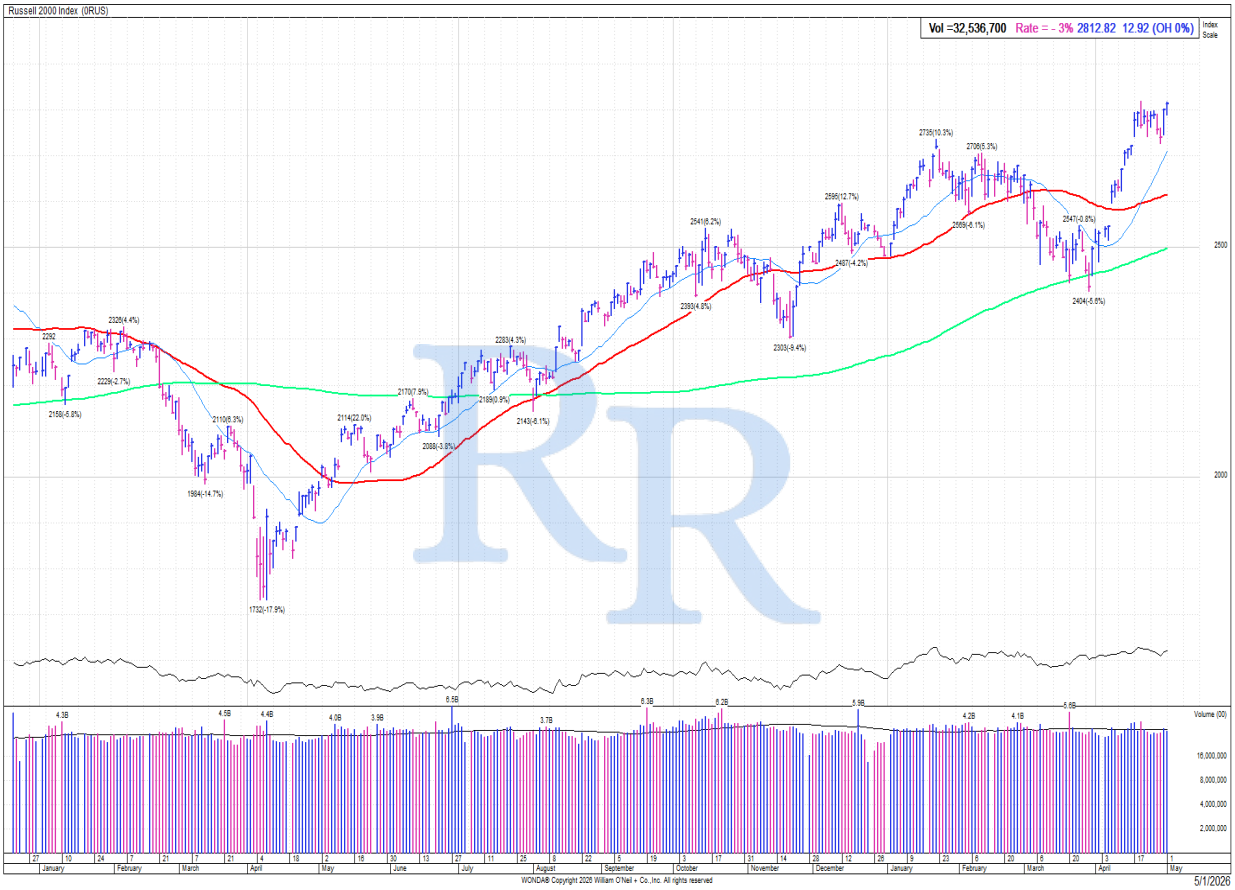

NVDA has become problematic as it dove lower last Thursday and Friday. I built an oversized hedge and will hold it until it rights itself. NVDA's weakness is not a death blow to the market, but it is a material negative. Competition and faster horses may be a developing problem for NVDA.

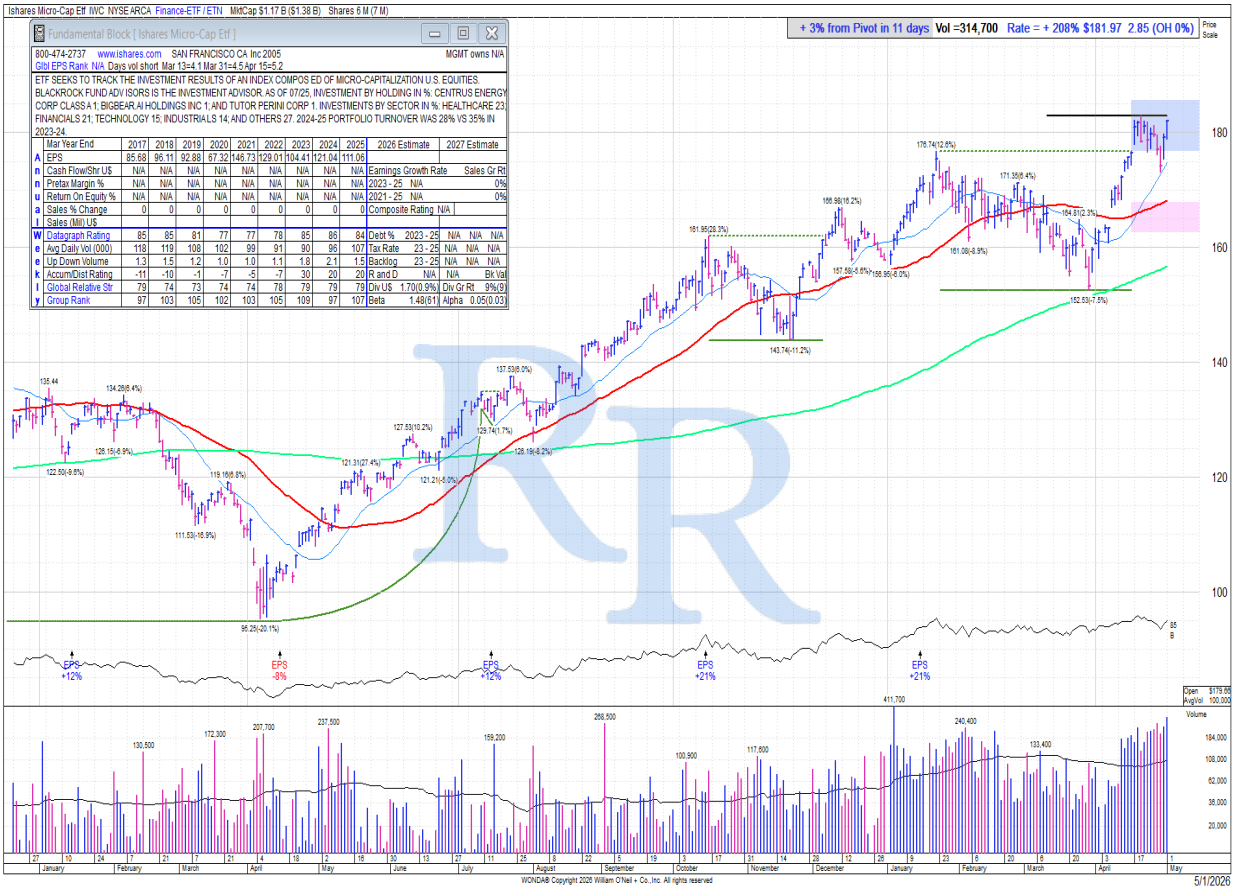

Client or proprietary accounts hold this position.

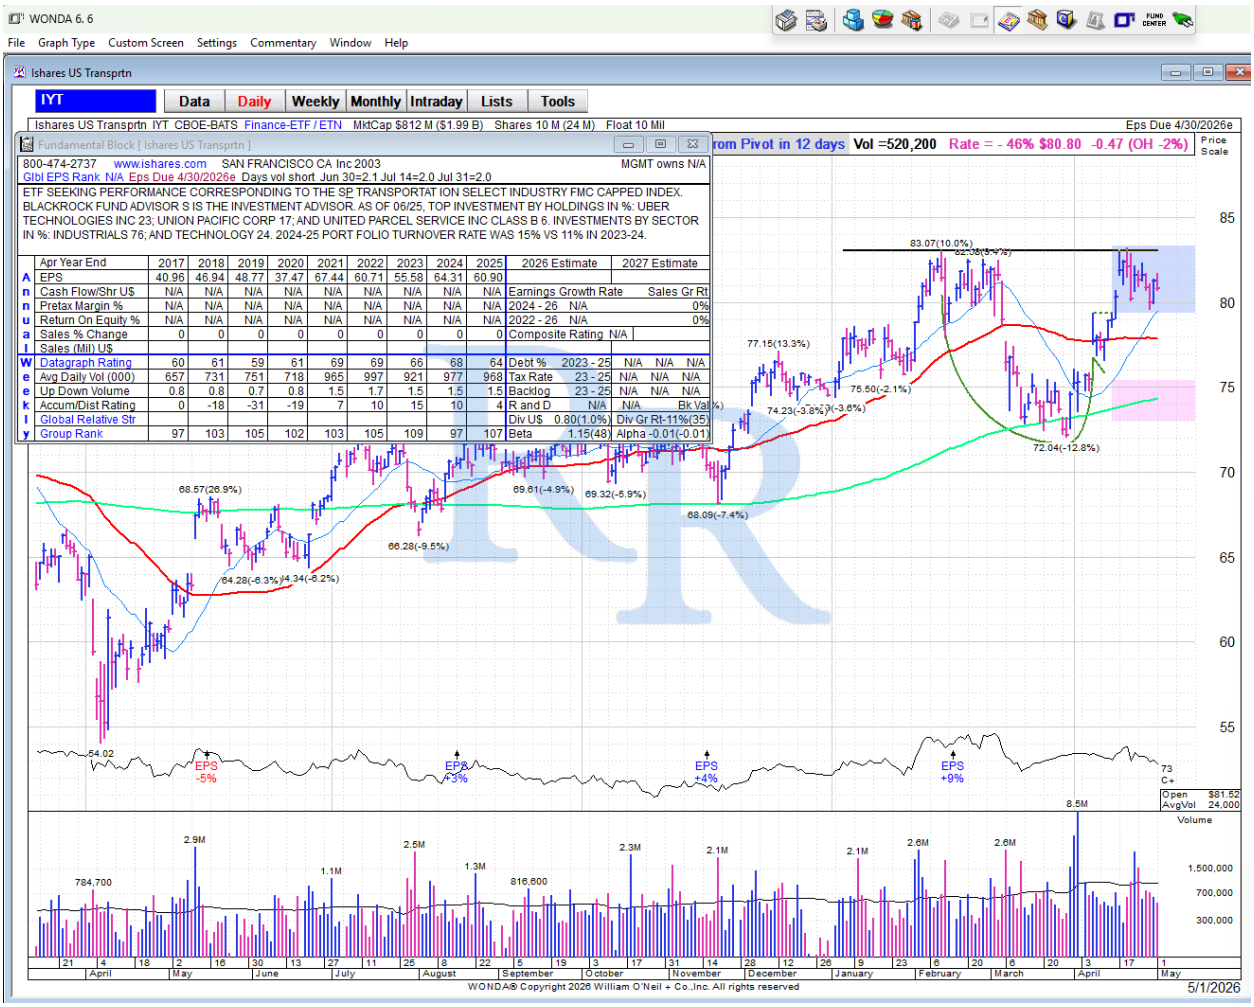

AVGO and similar leaders may be using NVDA for funds. Pivot near $429.50.

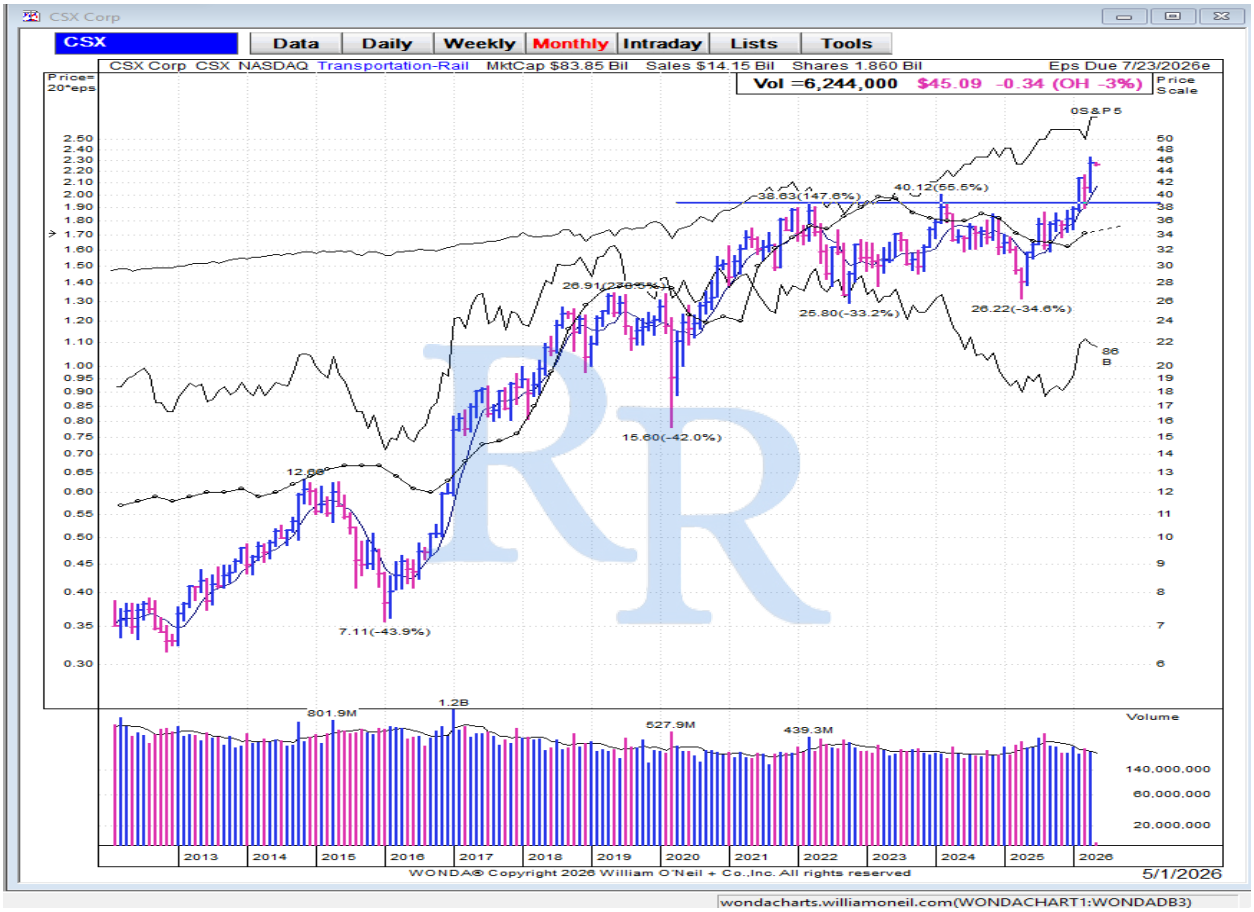

Russell 2000 is one of my best ideas as it is sporting a tight digestion after its mad dash up off the lows. IWM is the equivalent ETF, and for the cowboys, you can ramp it up with a 3X levered ETF, TNA, which I was building a position in last week and will top it off over $62.75.

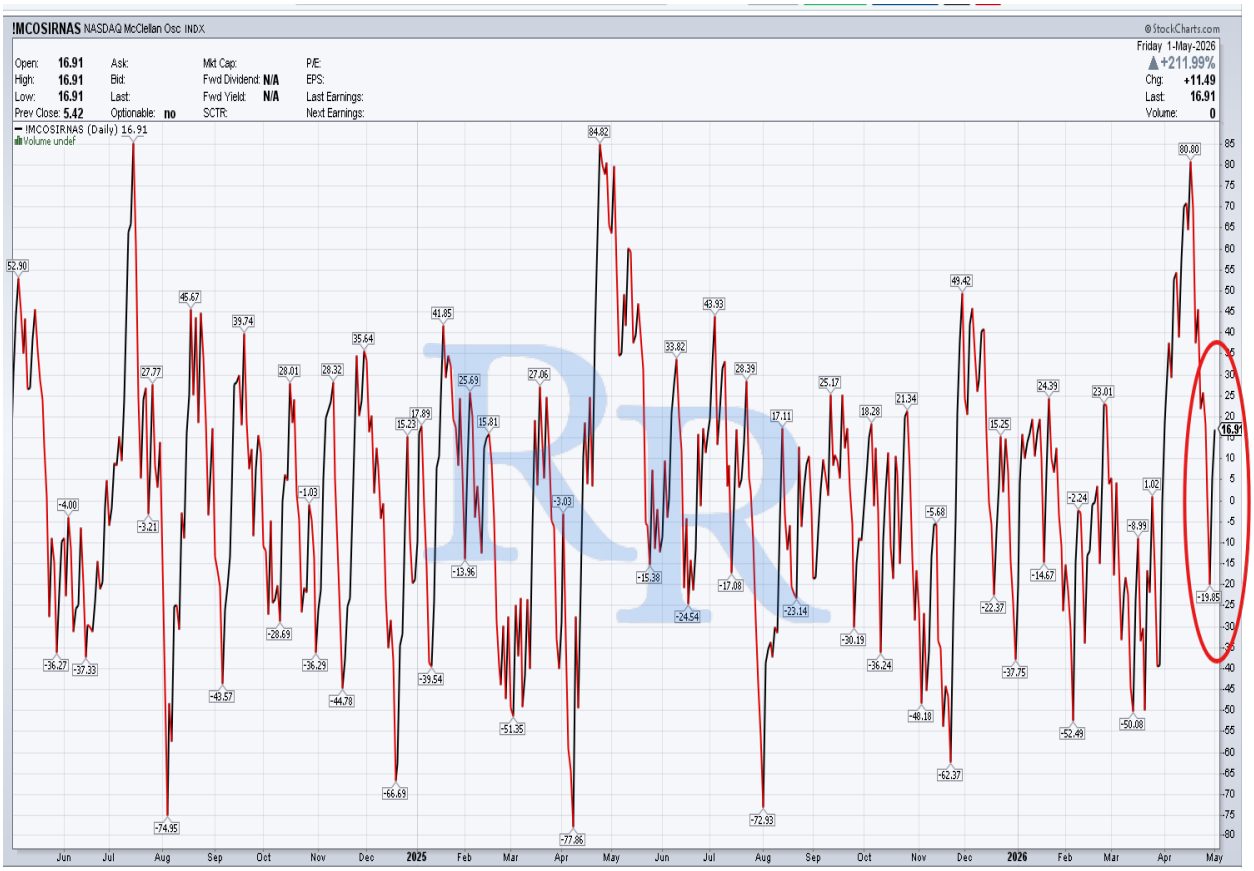

IWC looks exceptional into new highs.

IYT: If you look at freight loadings, you will say the US economy is on FIRE. Pivot over $83.25ish.

CSX has broken out over a four-year base.

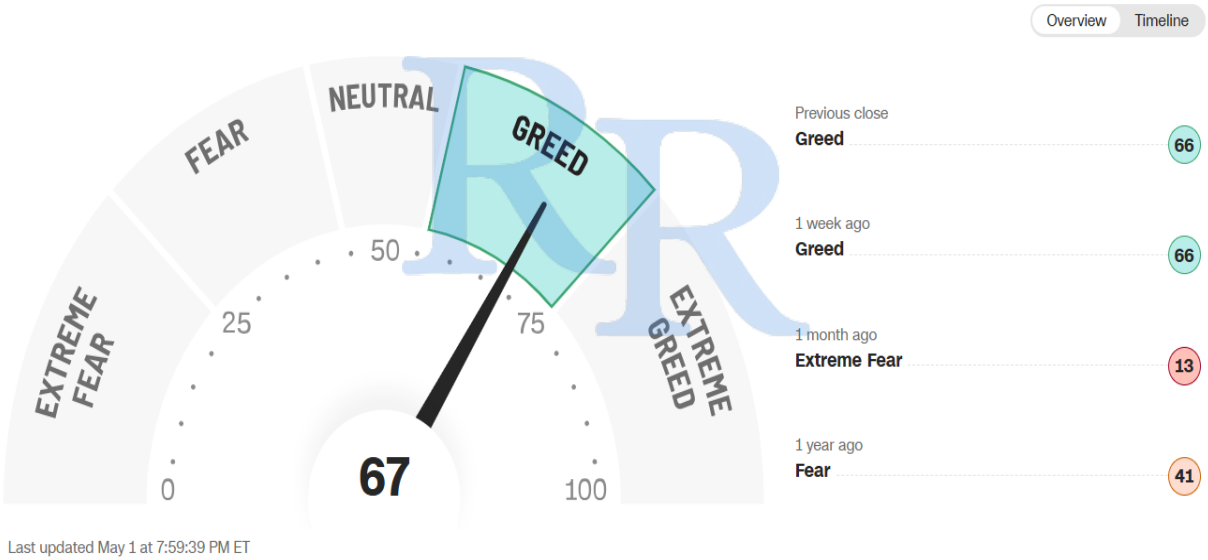

McClellan Oscillator scooted just below zero and ripped higher Friday. The buying in equities has been unrelenting and has not given those who doubted the rally an opportunity to get in with the safety of a digestion.

VIX has finally closed on a Friday below $18.00, which is the top zone of acceptable, and it gives me some confidence, but significantly lower values are needed.

Fear & Greed Index

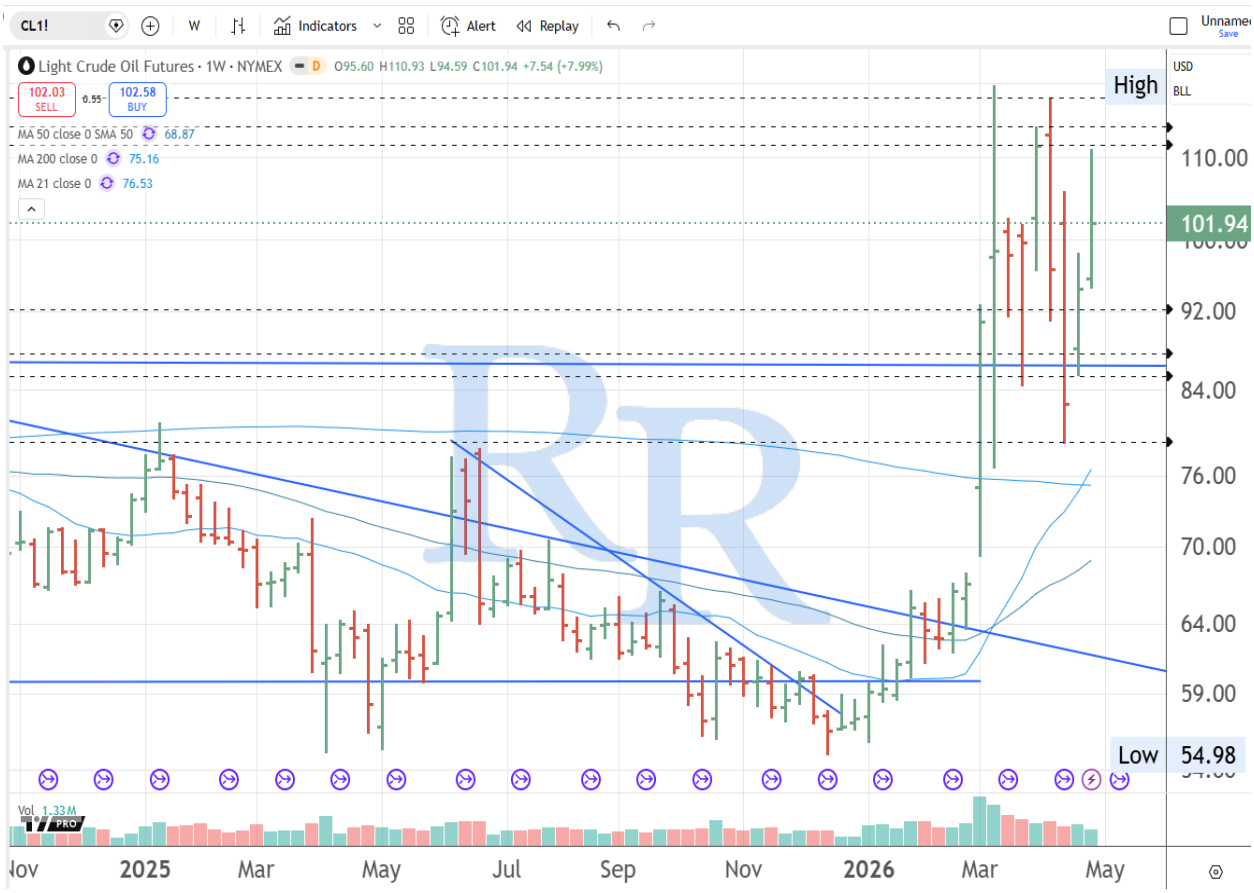

What emotion is driving the market now?
Learn more about the index

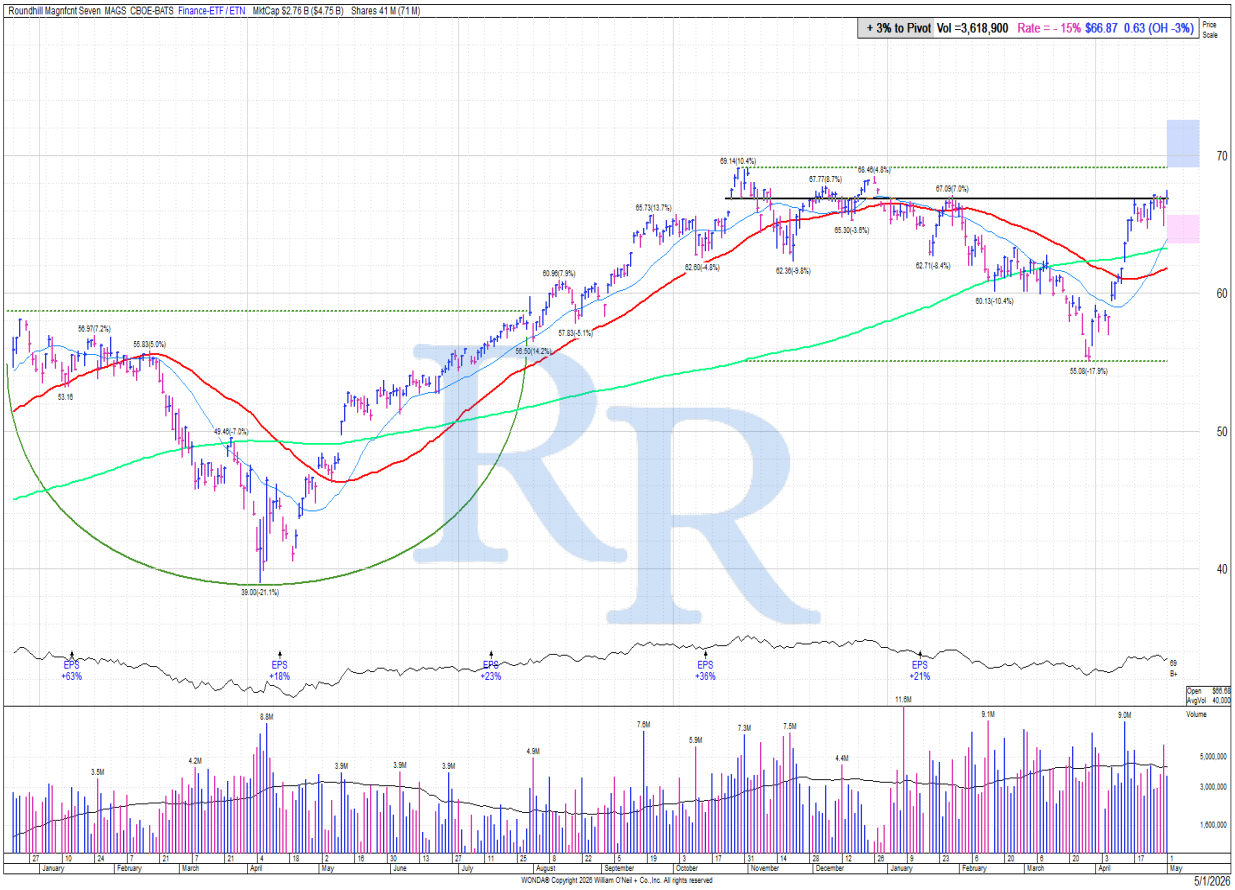

Last updated May 1 at 7:59:39 PM ET

7 FEAR & GREED INDICATORS

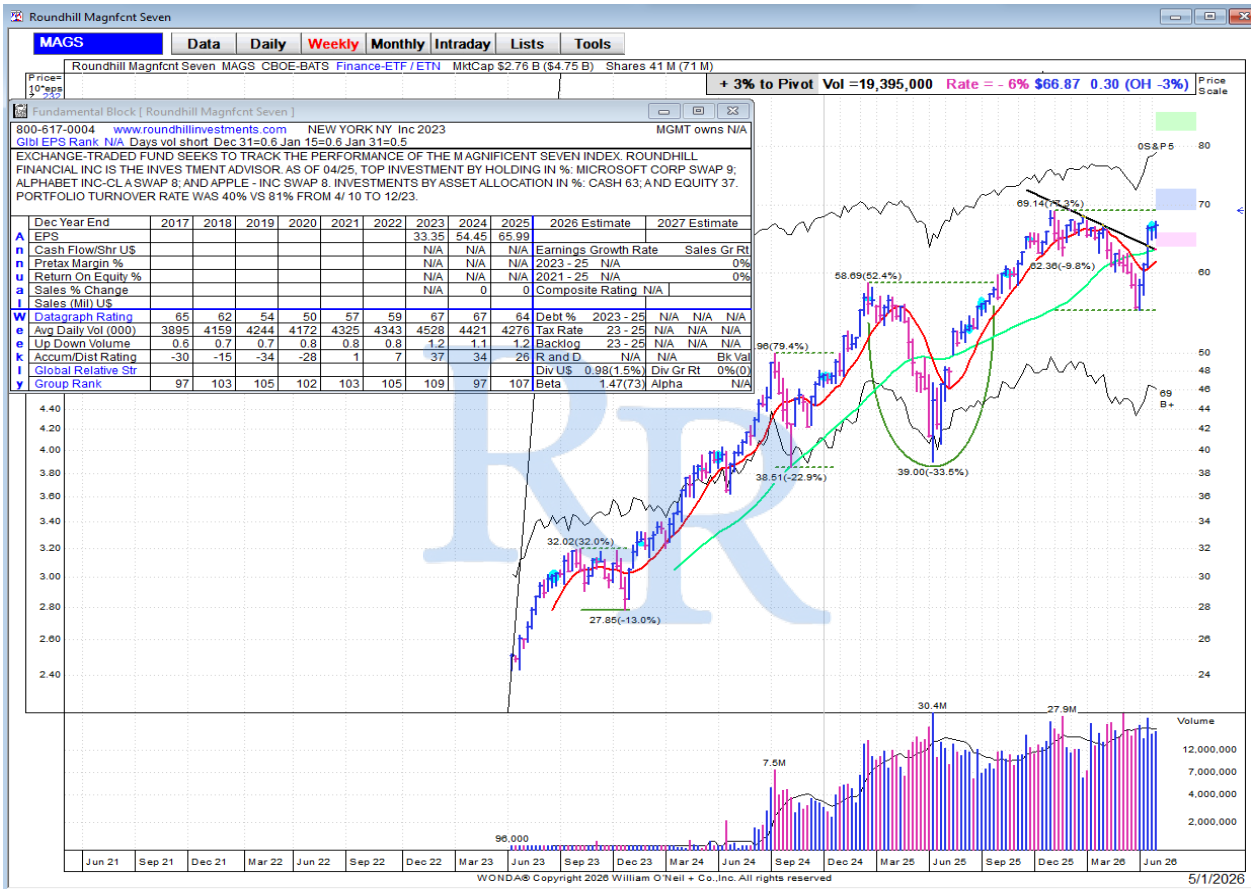

Fear, but not greed, leaves room for higher equity prices before material digestion arrives.

Crude: The chart is messy but has a bullish tilt to it. At the very least, I expect higher prices for longer than many expected at the beginning of 2026.

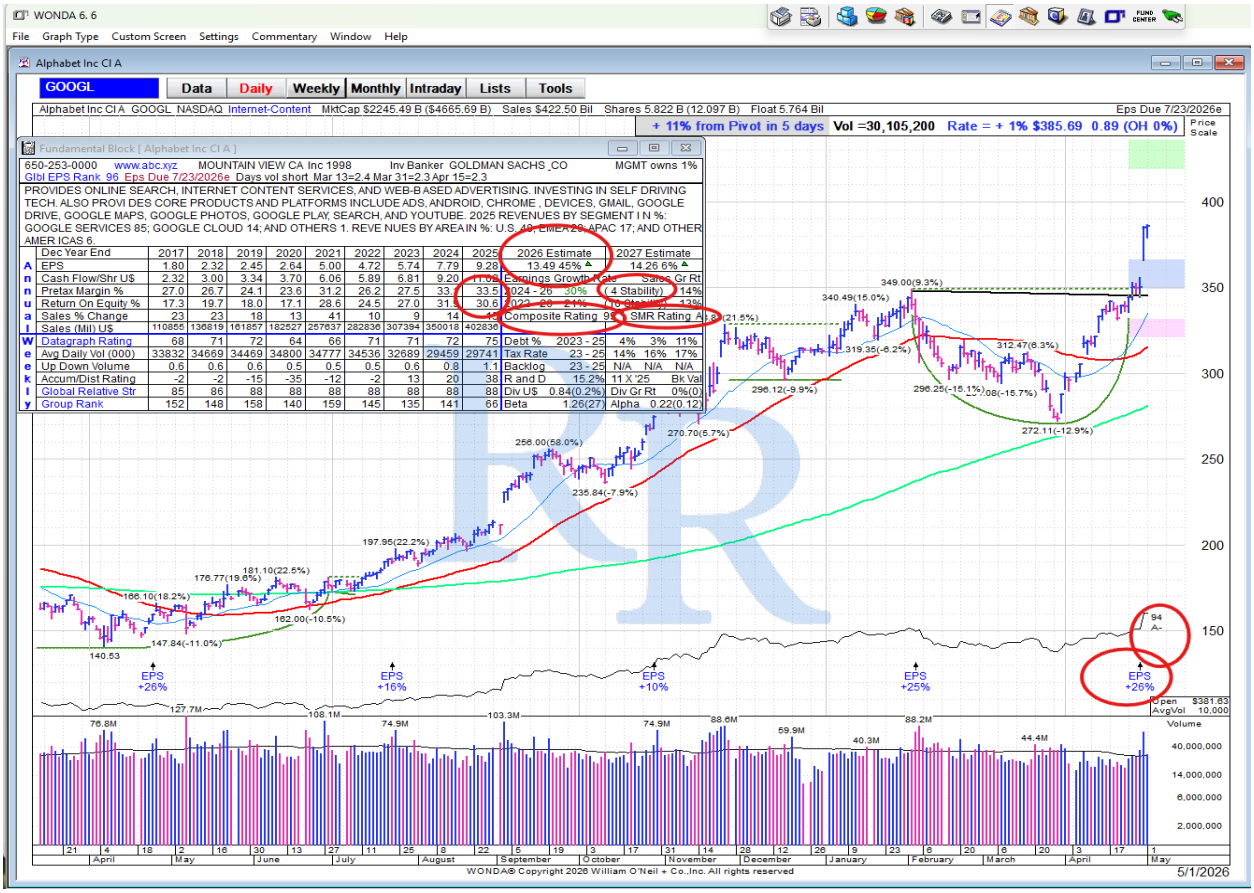

MAGS is a laggard but is sporting a beautiful C&H. Pivot over $67.60ish.

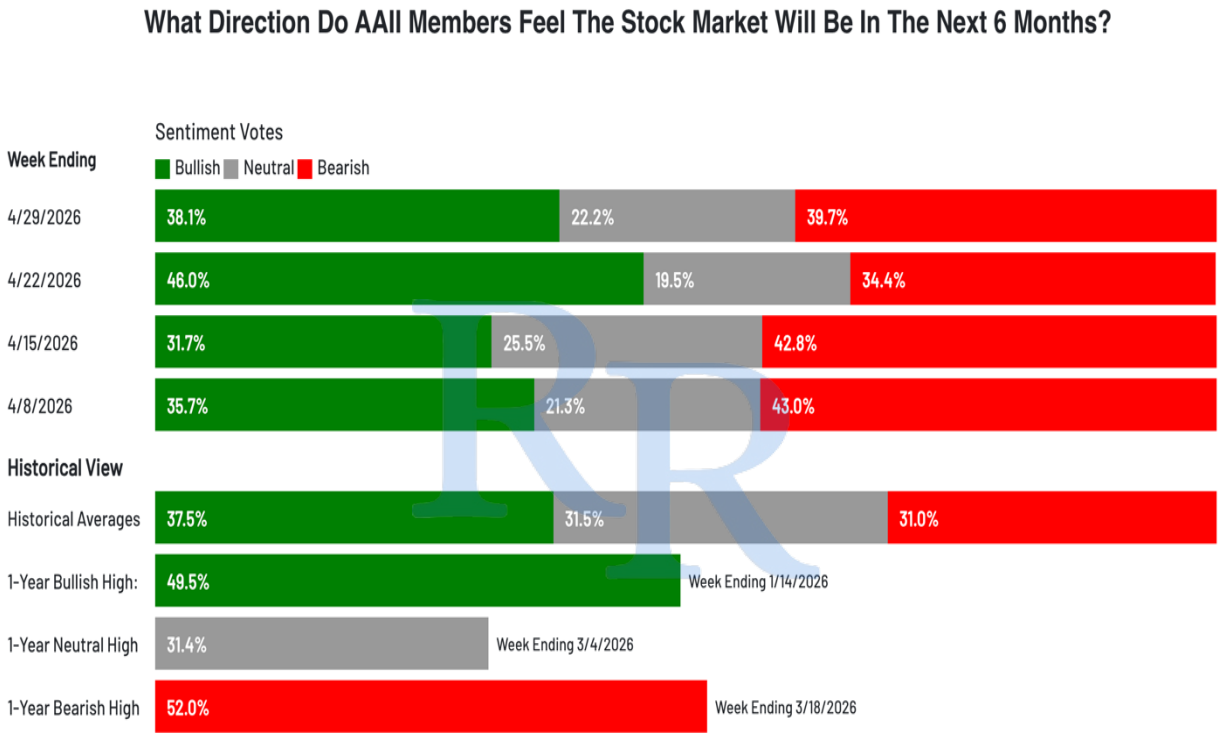

MAGS Weekly is sporting 3WT!!!!!!!!!!!!!!

Software – $12T Market Cap Recap: Hyper Backlog Trumps Mega Capex - *Big 4 (MSFT, META, AMZN, GOOG) EPS takeaways: 1) Capex keeps climbing, but ROI is evident via ~$2T backlog and accelerating cloud growth; 2) margin leverage holds for the hyperscalers despite AI investments, highlighting structural opex discipline; 3) GOOG has the cleanest AI narrative off another strong print; AMZN to keep closing the WMT valuation gap; MSFT sets up for a catch-up trade; META likely remains in the penalty box pending clearer capex ROI.* https://javatar.bluematrix.com/pdf/cx4cNELq

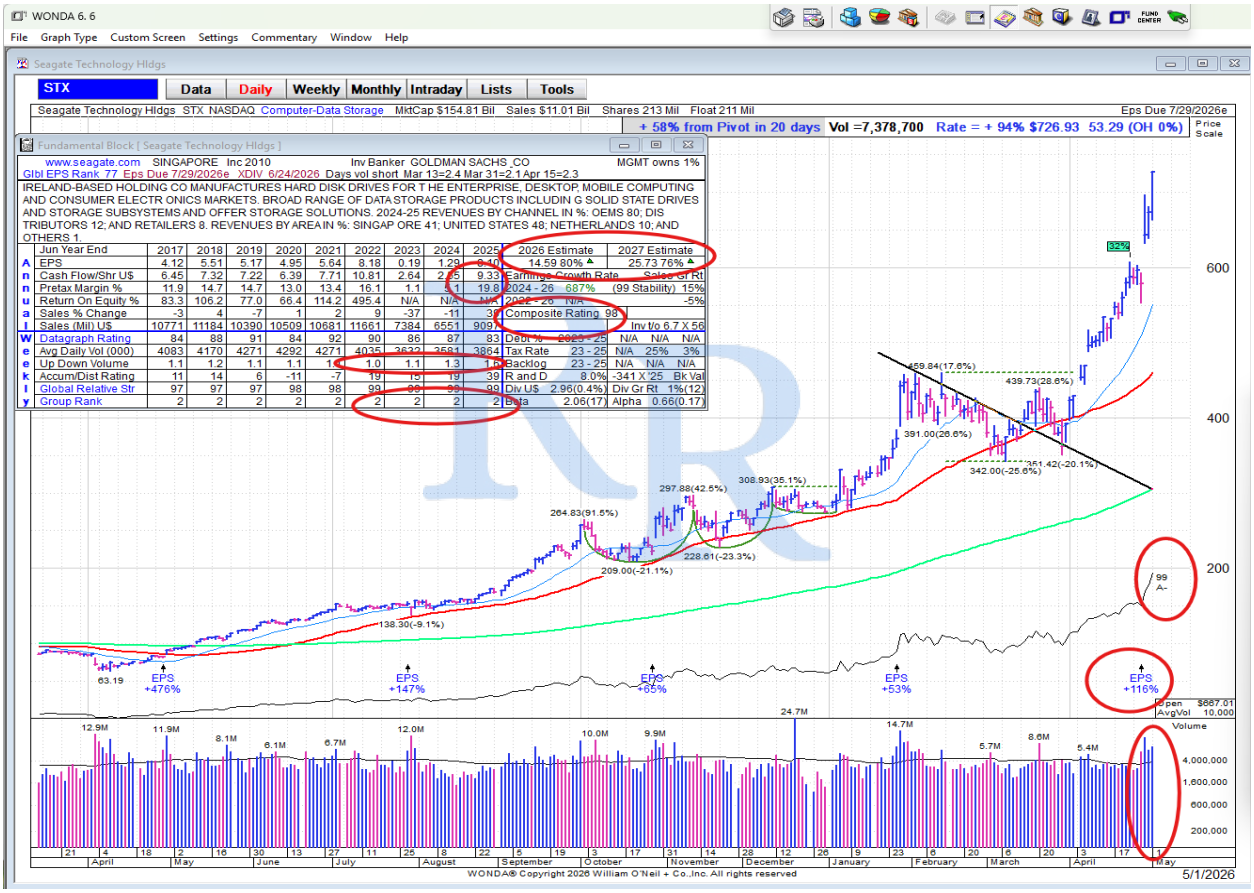

GOOG is by far the leading MAG 7 name, but AMZN is coming on as well.

GOOGL, MSFT, META (Thill, Buy) *We're out with takeaways from last night's tech earnings. We note that the aggregate cloud backlog soared past $2T, up 176% Y/Y, while capex is expected to spend ~$769B in CY26, up from $713B prior to earnings. Hyperscaler margins are expanding despite heavy AI investments with MSFT expecting FY26 operating margins to expand by ~1pt and DD% operating income growth in FY27. GOOGL's strong quarter showed the co. can take share while scaling profitably with 63% Y/Y growth vs. Street at 50%. Meanwhile, META posted its fastest reported revenue growth since 3Q21 at 33% Y/Y. We're hosting a call today at 8:15AM ET to discuss.*

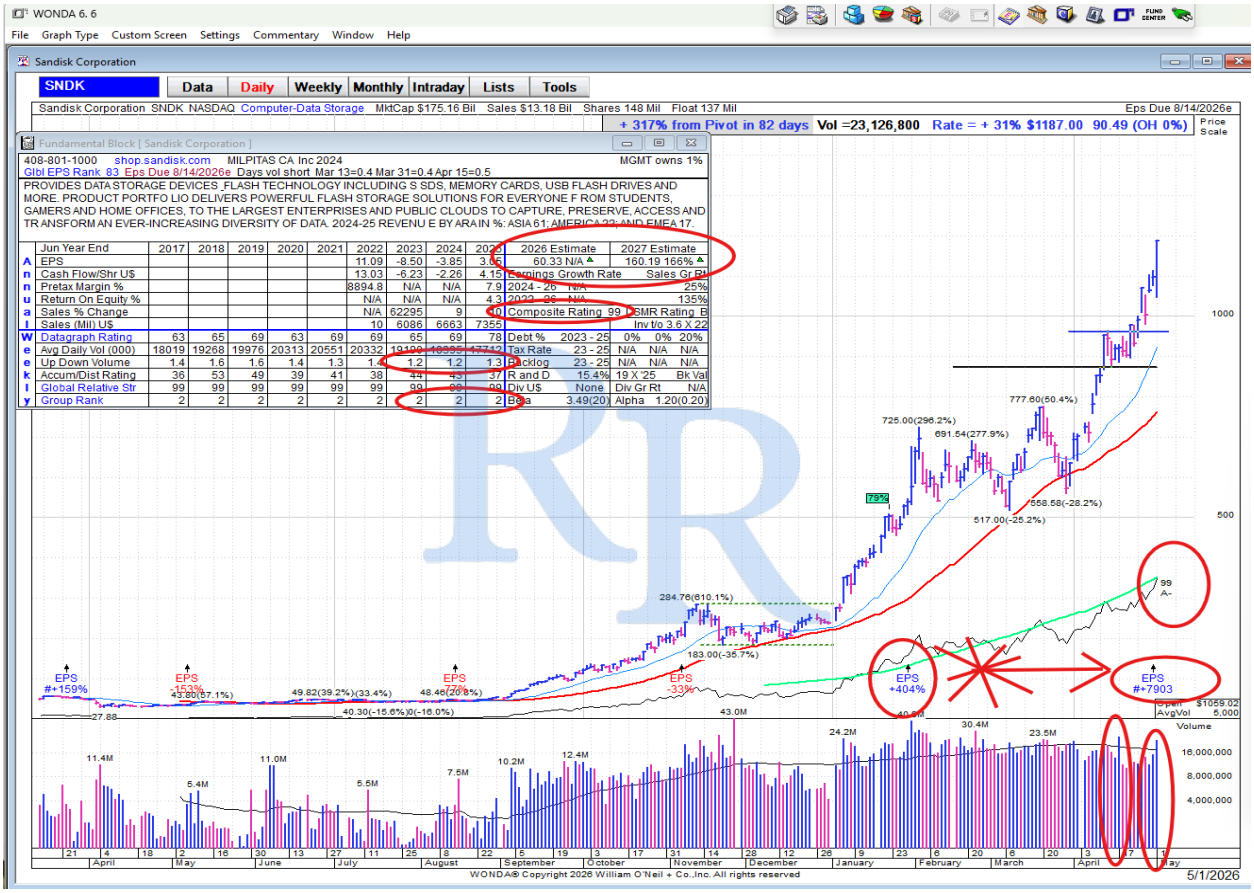

The fear after even the most minuscule digestion is amazing. Fear is trumping trend following to the dismay of most fund managers. This is the clearest sign that most people still doubt this rally.

▼ Potential TMLs – Stocks of Interest

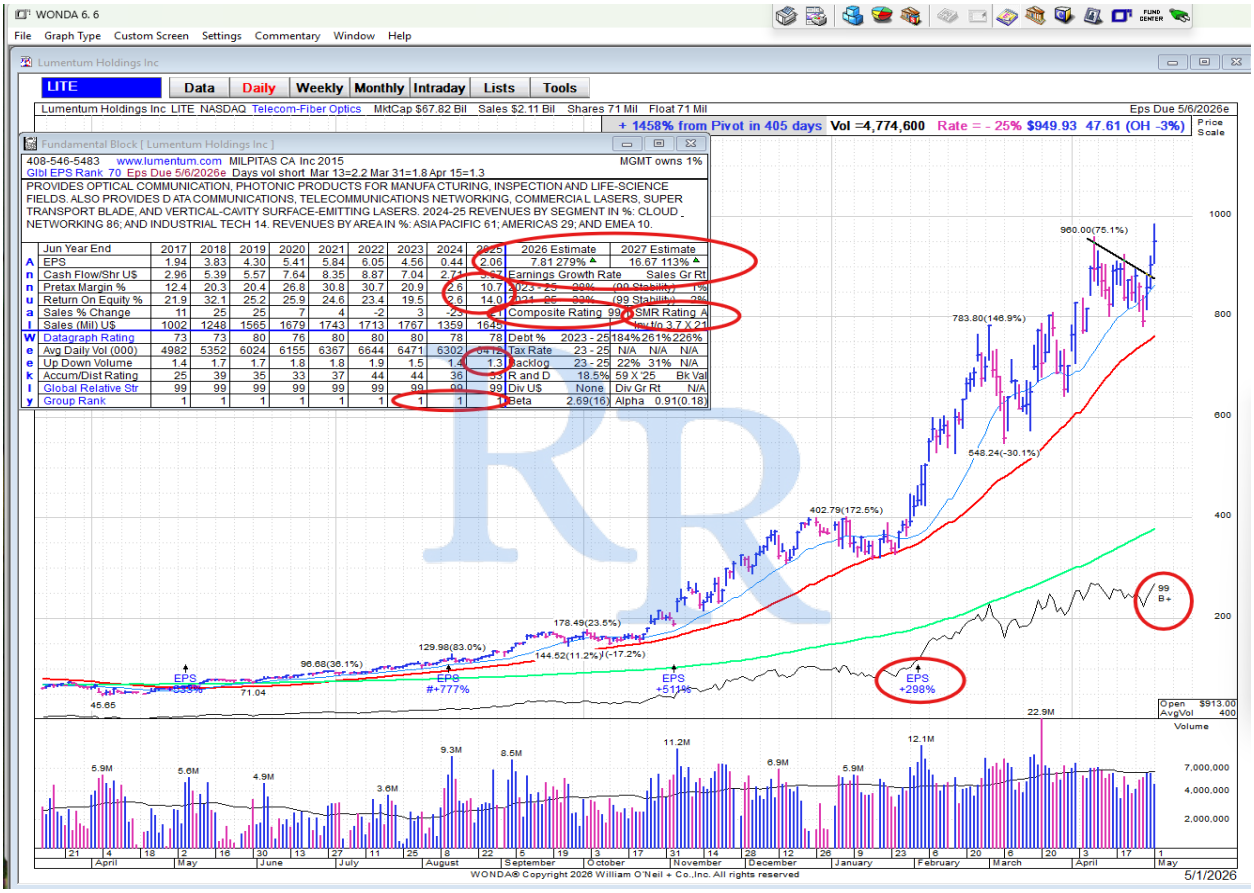

STX: Unbelievable move! It is now very extended. People don't believe me when I say it's common for leaders to 5X.

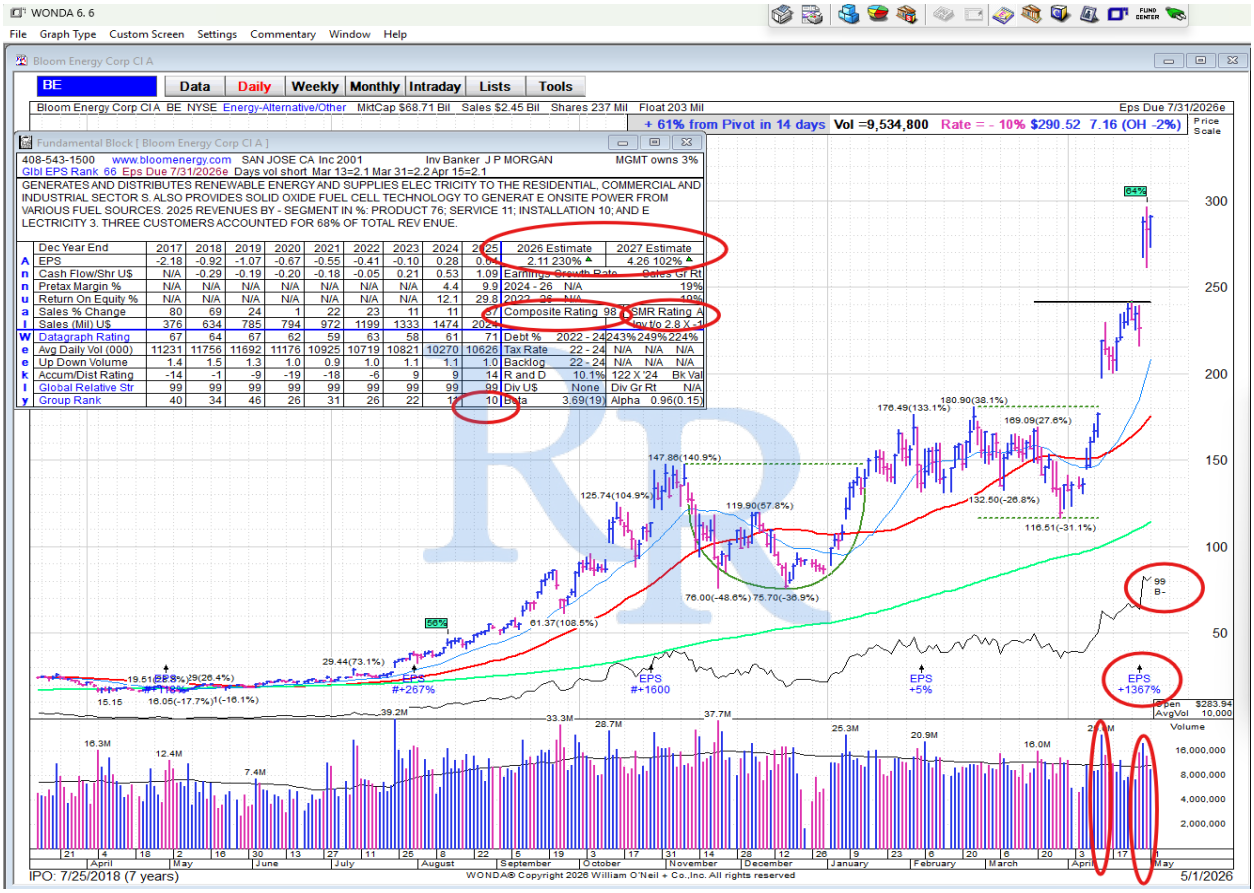

SNDK has been atypical, as when it broke out @ $58.00, it had terrible financial metrics, and I PASSED, UGH!!! Markets are very smart as they discount the future. But the recent numbers have been nothing short of COLOSSAL, and they continue to accelerate. Last week's EPS report was one for the history books, +7903%!!!!!!!!!!!!!!!! Obviously, it is now extended.

Client or proprietary accounts hold this position.

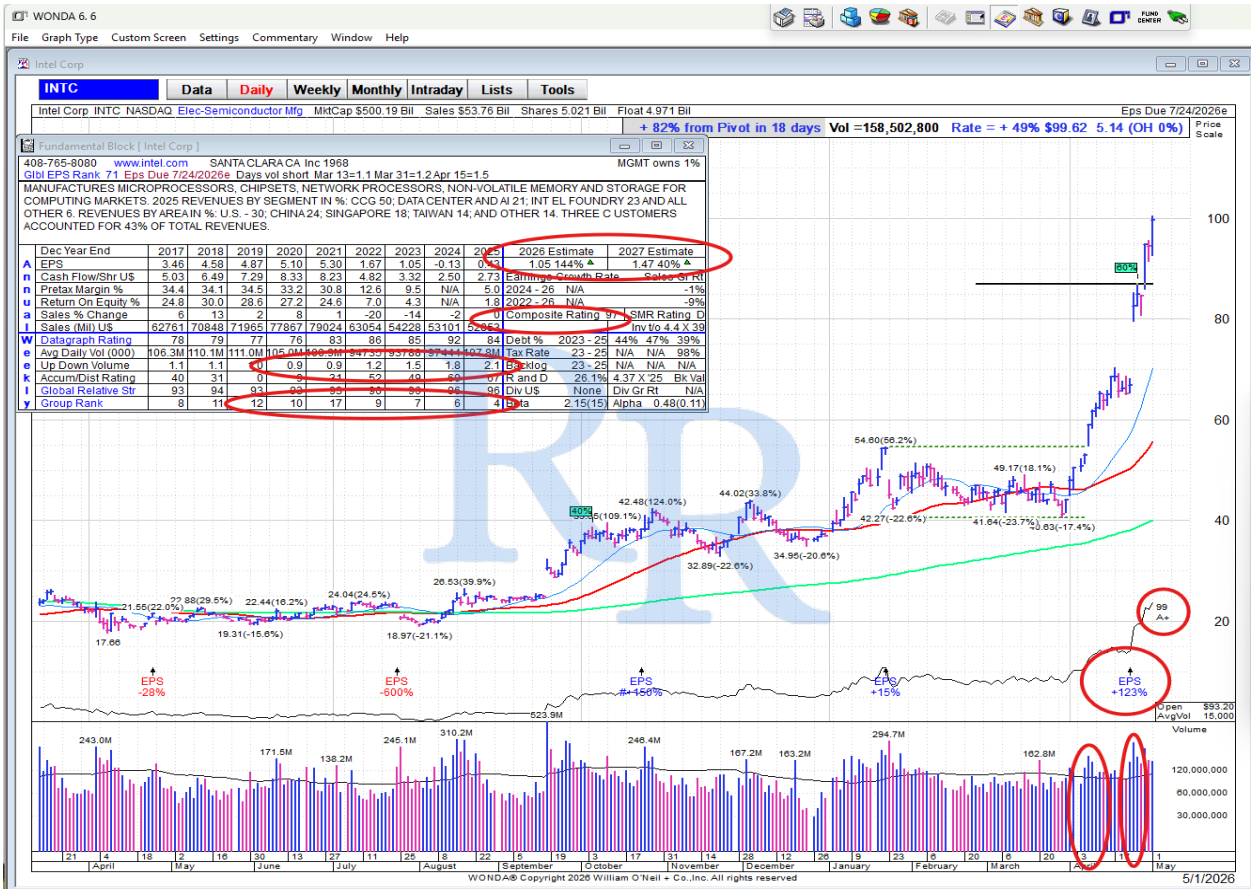

LITE: Earnings are due this Tuesday, without cushion, I could not sit into earnings.

Client or proprietary accounts hold this position.

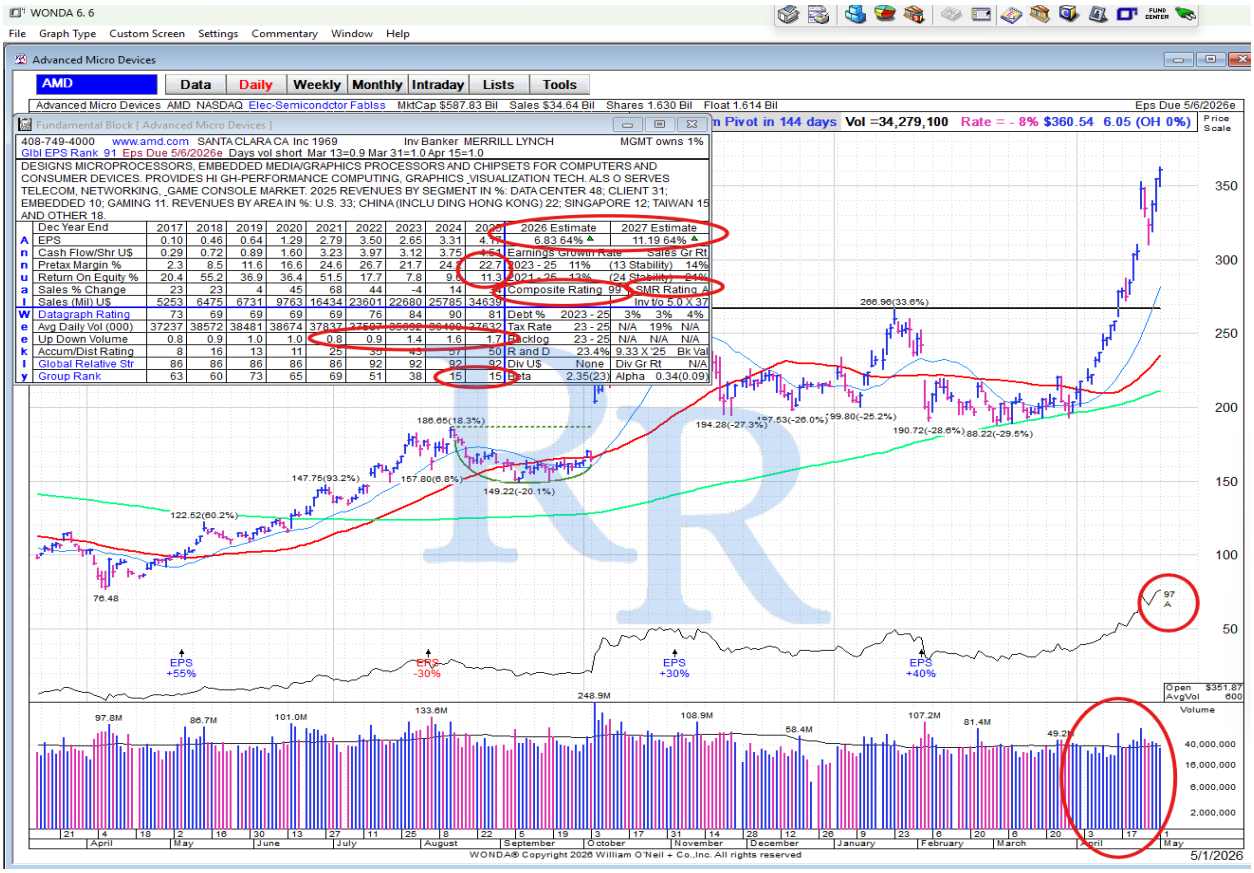

BE is acting a lot better than the loose action in the digestion below $180.00, and now has five weeks up in a row, which drove me to increase my exposure, but still kept my cost much lower. BE has been a much more difficult stock to sit with, as it dove too far below the 50DSMA in early April, for comfort. Thank God for hedging.

Client or proprietary accounts hold this position.

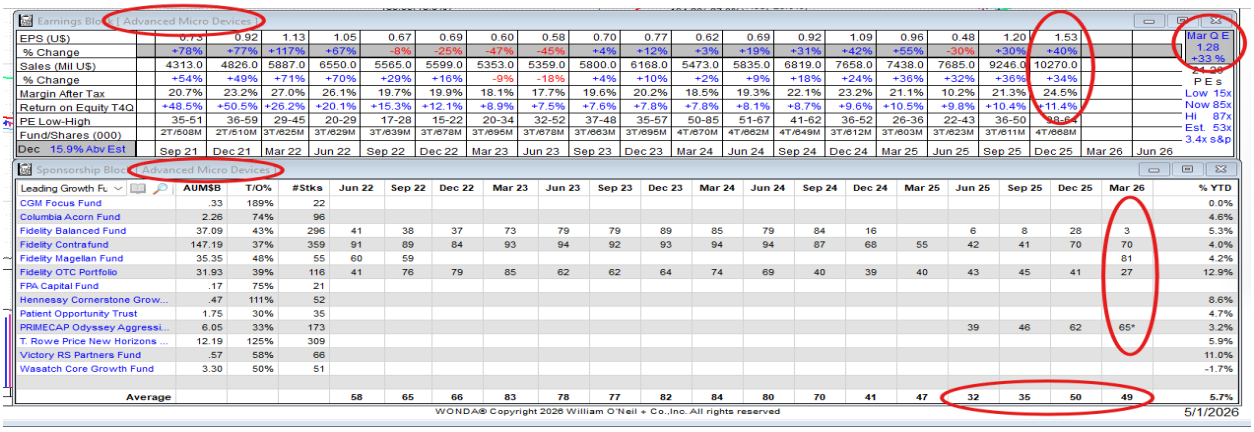

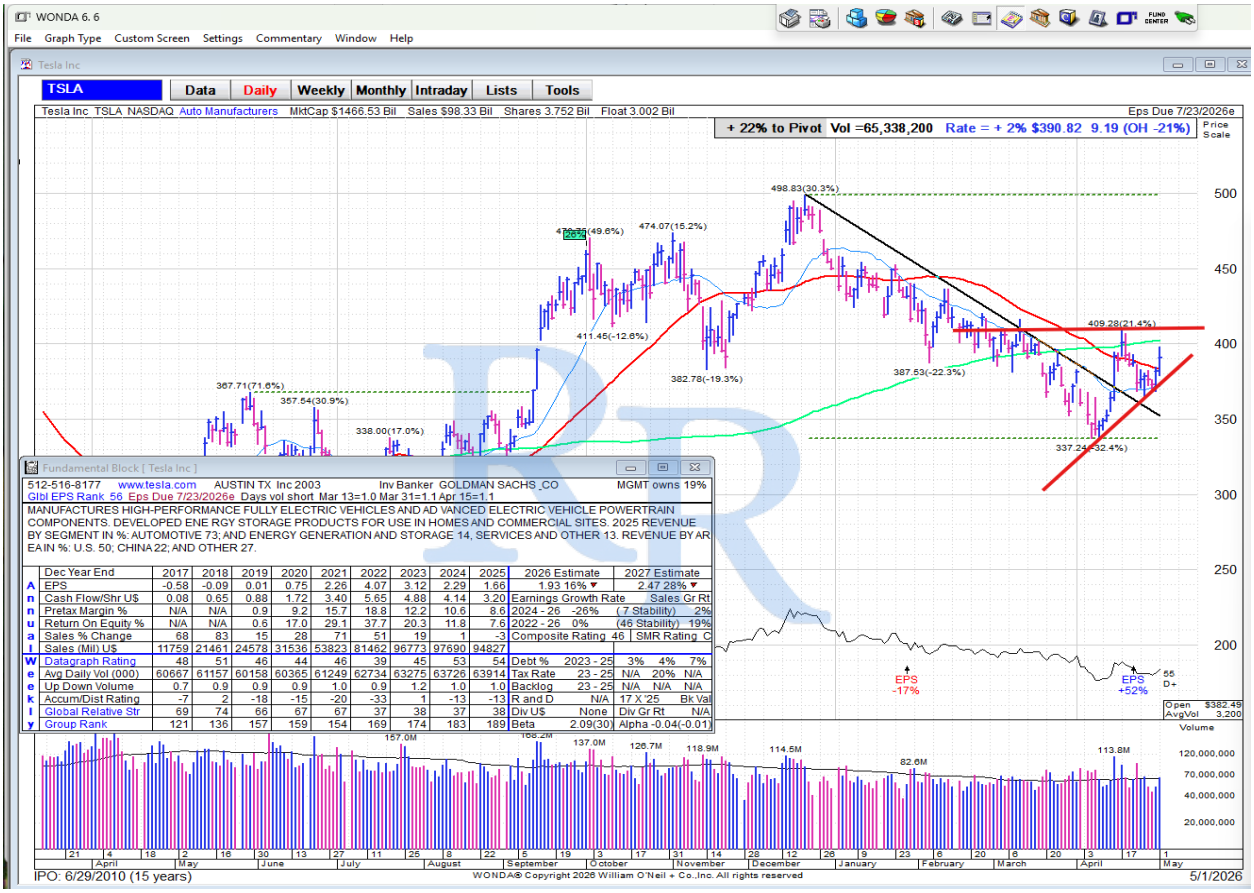

INTC: It's all about GPUs to CPUs. This move for a mega-cap is rare. Note, the digestions have been atypically short. *2.1U/D* is gonzo for a mega-cap.

Client or proprietary accounts hold this position.

AMD: One of my favorite analysts, Beth Kindig, has been bullish on AMD for a long time, and I thought it was a dog as RS was low and the stock was in a sideways trend at best. BUT as the GPU to CPU revolution began to be appreciated by Wall St., it lit up like a Christmas tree. I now consider it, institutions consider it, proven by price and volume action to be the #2 name in this blistering hot group. INTC is #1. AMD is worth considering on Two Weeks Tight =2WT or longer digestion. Be careful not to over-concentrate in semis, as it's easy to do with so much leadership from this group.

TSLA: Now has a possibly higher low in place. 55RS is in the no-go zone, but for those true believers, pilot positions could be started over $409.50 early pivot, but I will not get big, until, if, if, if it emerges above the Livermore large number $500.00 pivot. Until then, it's UNPROVEN and high risk of whipsaws and failure.

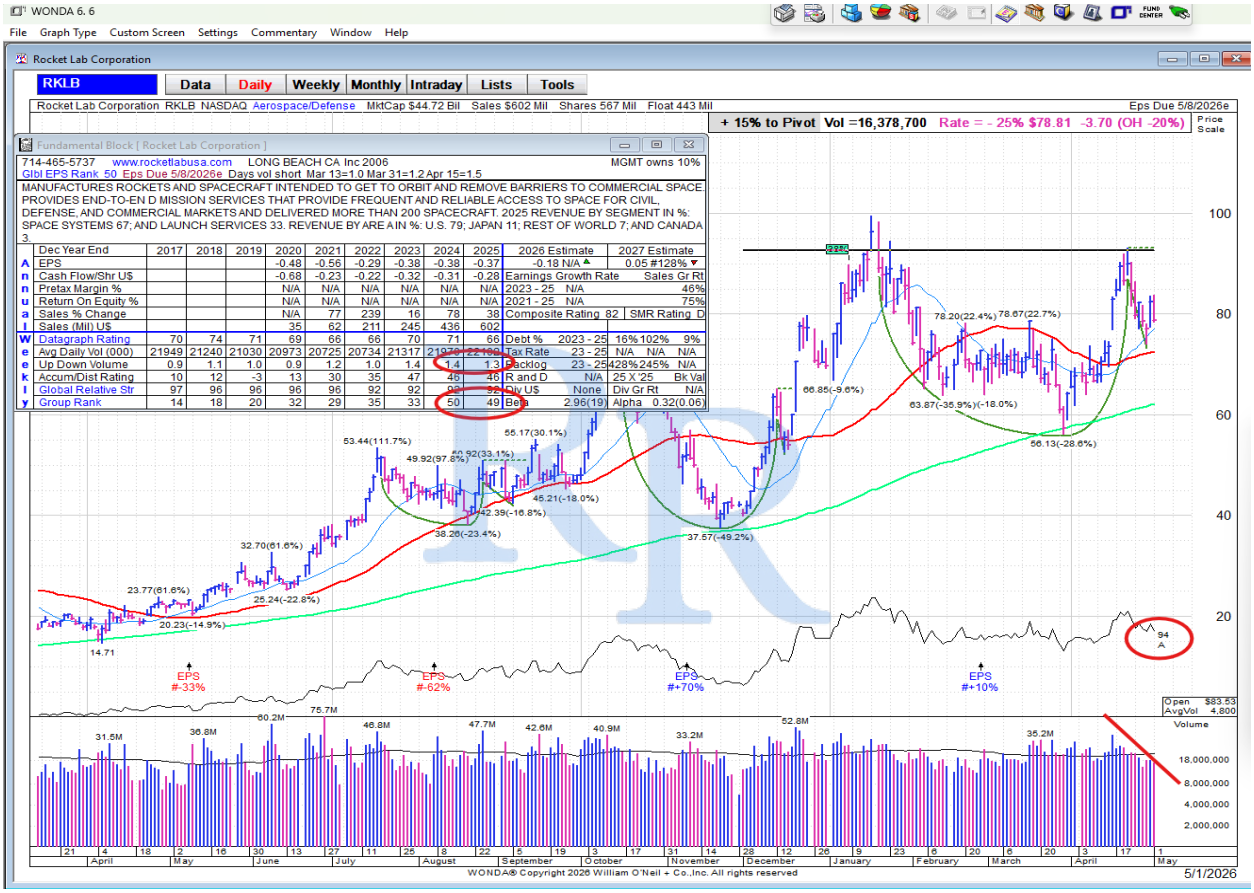

Client or proprietary accounts hold this position.

ETON: For my patient cowboys who were willing to take a risk on this flea, congratulations!!!!!!!!!!!!!! 97Comp, massive earning quality in a literal penny stock.

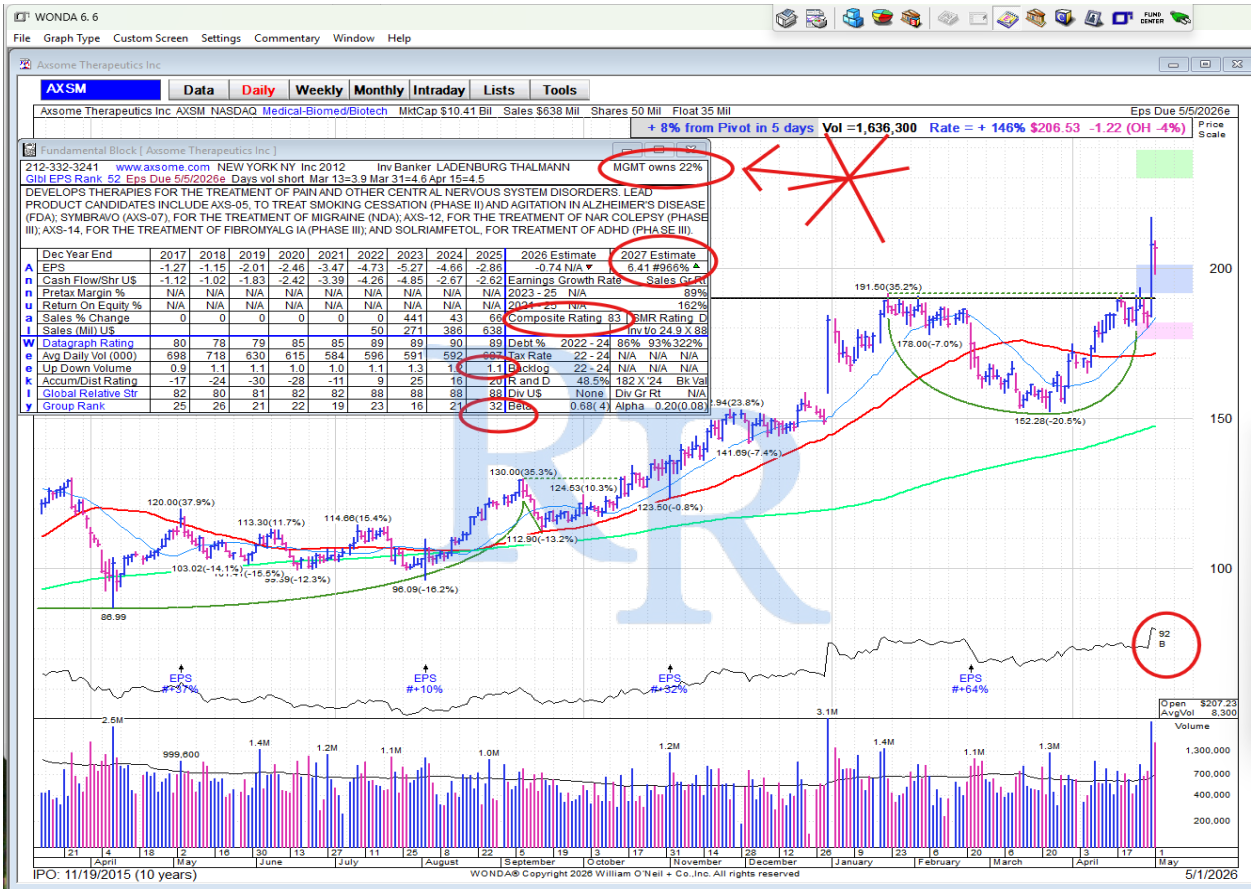

TVTX: I have no clue what fundamentals are driving this name, but this tiny new IPO flea has a great chart and is breaking out right now. Cowboys rejoice!!

RKLB is testing its double bottom pivot. There is a lot of interest in this group, even though they have no earnings. Caution: when SpaceX goes public, the public space names will be sold as a source of funds to pay for new positions in SpaceX. Pivot is over $93.25.

Client or proprietary accounts hold this position.

AXSM came out over its short handle last week. Note the Spectacular EPS estimate. +966%.

AAOI is an erratic personality leader with earnings due this week.

CIEN: What makes it a TML is, of course, the 99RS and 99comp, but the institutions continued to bid it up right through the index's five-month digestion. ***Client or proprietary accounts hold this position.***

VRT is a quality name that continues to work higher.

STM: Early leader that I don't understand.

GEV: Quality that continues to work higher.

DELL: Four days of digestion, hardware leader.

ROIV is digesting.

SLV has a double bottom in place.

SOLS: pivot over $84.20.

EC: I love the pattern, but it's been a slow mover. ***Client or proprietary accounts hold this position.***

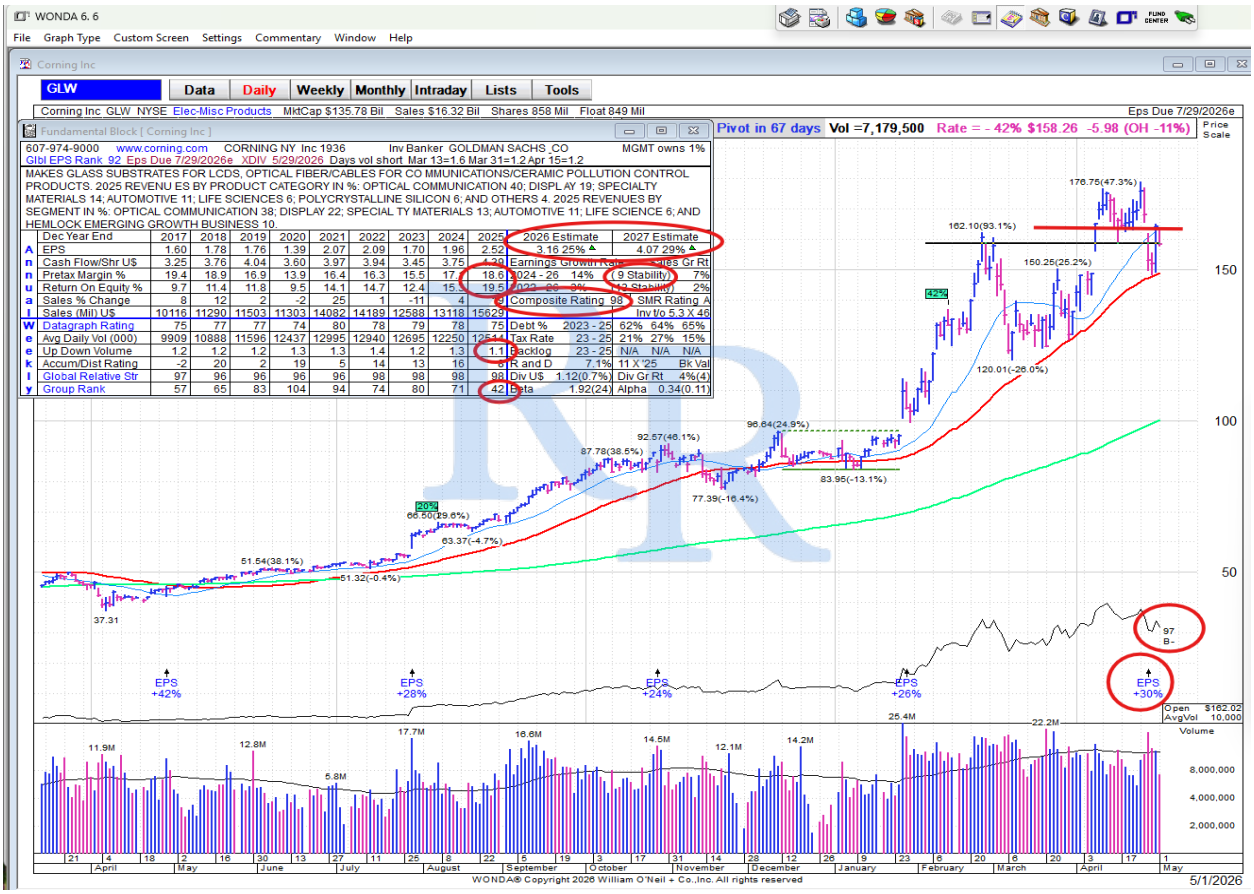

JAZZ: Continues to work out of its 11-year base.

CAVA is firmly in an uptrend but has significant overhead. This is largely a fundamental play, pivot $99.

WWD remains at the lows of a Darvas box.

CDNS is a pure fundamental play right now, but with technical improvement, I could get long quickly.

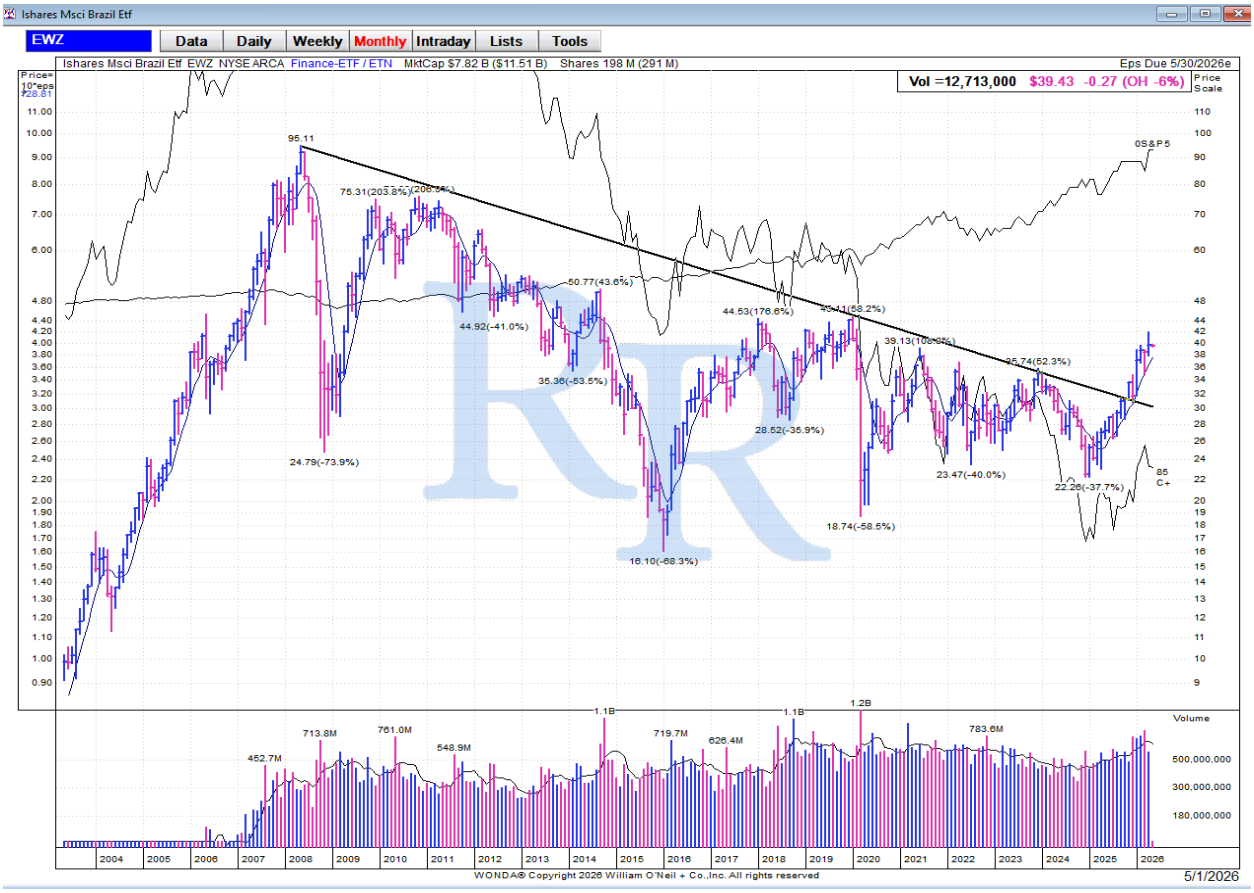

▼ Potential Leaders with Overhead

GLW has a little overhead at $162.51, and I would not add until it clearly exceeds it. GLW is a quality name, but it did not wow the street with its earnings beat. I have trimmed a bit, but will not totally bail unless it decisively breaks the 50DSMA.

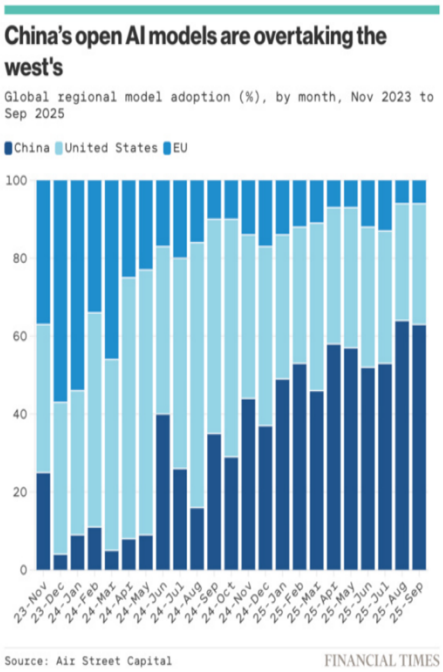

Client or proprietary accounts hold this position.

▼ CHINA and Other Countries

EWZ: Brazil, positions can be built right here.

The State Of Ai: Is China About To Win The Race?

- By 2023, China led in AI citations (22.6%) and patents (69.7%), ahead of Europe (20.9%) and the US (13%), per Stanford's 2025 AI Index.
- While the US still leads in top-cited publications (50 vs. China's 34), its dominance is declining.
- In 2019, 59% of top AI researchers were in the US and 11% in China; by 2022, that shifted to 42% and 28%.
- In 2024, US institutions built 40 top AI models, China 15. Yet Chinese models like DeepSeek-V3 and Qwen 2.5-Max now outperform US counterparts in algorithmic efficiency.
- China is poised to lead in applying open-source AI. It now surpasses the US in monthly model downloads, per Air Street Capital. In AI-driven fintech, e-commerce, and logistics, it already leads.
- The most promising AI use may emerge in hardware—drones and robotics—where China's edge in manufacturing and embodied AI gives it a strong advantage.

MIT Technology Review

NYU STERN

LEADING IN THE AGE OF AI

Is China about to kick the US's ass????

▼ One of Bill's Golden Rules

Anticipating reactions to news is a *mistake*. The Dominant Fundamental Factor may be something else. The coronavirus market was focused on Central Bank easing, and indexes went way higher vs the doomsday view that a global depression was at foot.

Knowing what you did wrong is not enough; you need to know why you did it. Your psychology must be in order for you to succeed in the market.

▼ Random Thoughts

Believing the trend and sitting has been the perfect plan, but few have executed it. Most, especially big hedge funds, don't believe this rally and remain wildly under-invested.

Earnings have been mostly good, and despite getting clipped in TER and GLW, I am inclined to continue hedging ½ of my positions with bear put spreads rather than 100% hedges.

There has been some concern spreading on X about the lack of new highs. There is always a bogeyman that will make you question a rally. The questions we need to ask are: "Can we make money, and have we been making money??" If the answer is yes, forget the bogey man of the day and power ahead. Right now, we are in one of the most bullish environments I have ever experienced.

Stocks have unique personalities. Just like a large group of humans walking to the same destination. They are all trying to get to the same destination, but they take very different paths. Some race straight to the destination, some crawl slowly, some diverge in different directions, and some fail to reach the destination.

What could go wrong? Many things. There are dozens of asteroids orbiting the the global economy and the "Golden Goose" that we can't see that could derail the near-perfect mix of variables that is gunning the AI revolution and has the FED on hold. The one issue I see brewing is inflation rooted in rising crude prices. If, if, if the CPI exceeds short treasury rates, it could get out of hand and would be kryptonite for risk on and equities specifically. But it would likely gun BTC. It's likely the reason BTC has caught a bid. The counter to crude based inflation is AI induced deflation. The battle is on, and the trends will guide us.

CREATIVE PLANNING					@CharlieBilello		

Check out the forward performance above with the conditions we are experienced in April 2025. The odds are very favorable for IT and LT. Bill would be positioning himself with capital to pounce. Remember, just like in 2024, there will be dozens of stocks that will go up hundreds of percent.

75 years of evidence that prices will be dramatically higher in 12 months. If history repeats, what will it do for your net worth? What did 2024 do for your net worth?

CREATIVE PLANNING						@CharlieBilello		

Opportunities this good are rarely presented.

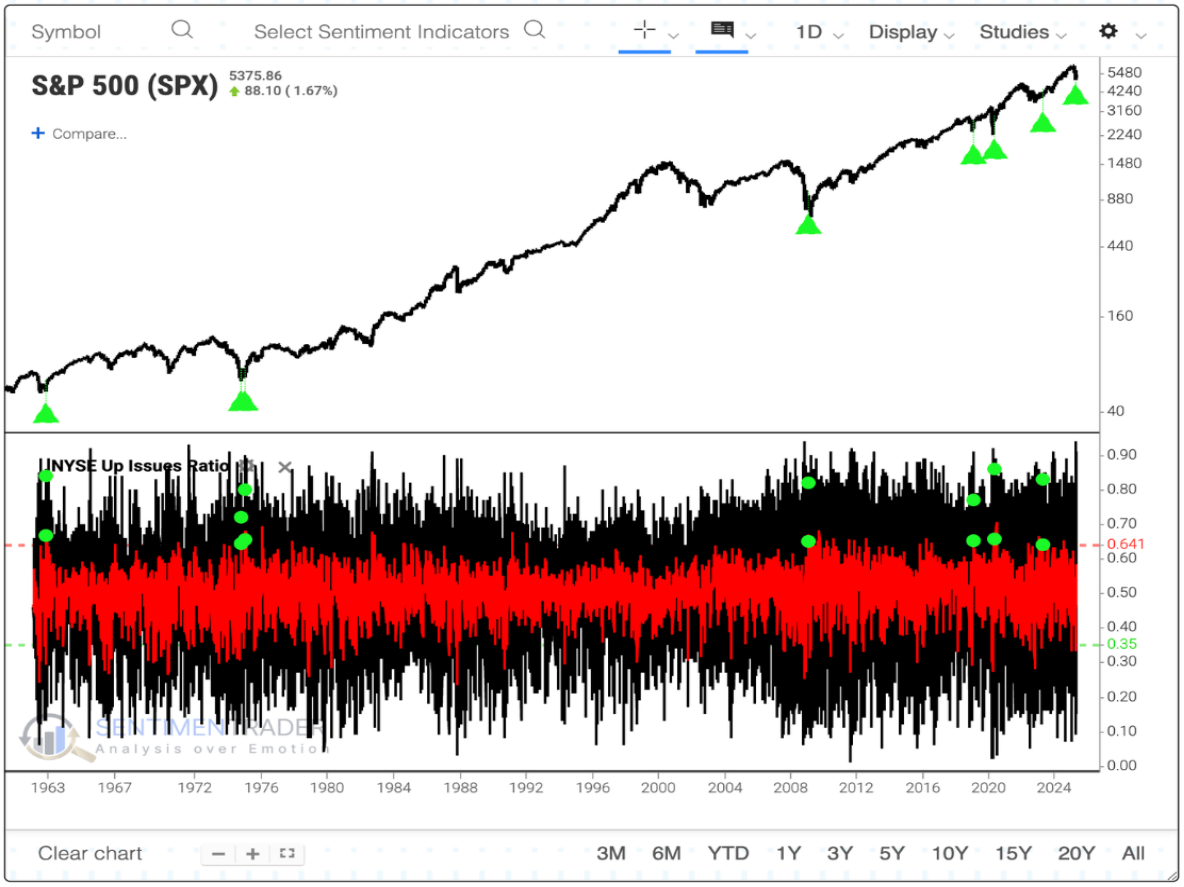

A third leg down is possible, just like 2020 and 1998, but this decline has been so swift that it increases the odds of a V-shaped recovery.

Talk about a bear killer.

S&P 500 after NYSE SuperZweig thrust signal

With all the historical evidence that bear conditions, like we just experienced, prices will be higher in 12+ months. Right now is the time to be funding your war chest for the growing opportunity to move up to a higher financial station. I feel the opportunity will be equivalent to 2024.
