I am beyond honored to get the above shout-out from The Legend, Peter Brandt. I'm not worthy, Wayne and Garth.

▼ Market Temperature

My Buy Window is: Closed.

Always cut losses in 33% lots at -3%, -5% & -7%—additional personal disclaimer at the bottom. All buy ideas require a significant pickup in volume to validate the breakout or buy point—minimum volume pickup of 40%, ideally 500%+.

0 is the most negative term outlook, and 10 is the most bullish. It's reasonable to say if the market temperature is 5, your total exposure could be 50% long.

Short-term Trend 1 to 3 weeks (2/10) My opinion of market temp would be 1 but a counter trend bounce higher could come at anytime but until a quality Follow Through Day=FTD materializes, I would use most bounces and gap up opens to exit everything but long term holds and consider shorting.

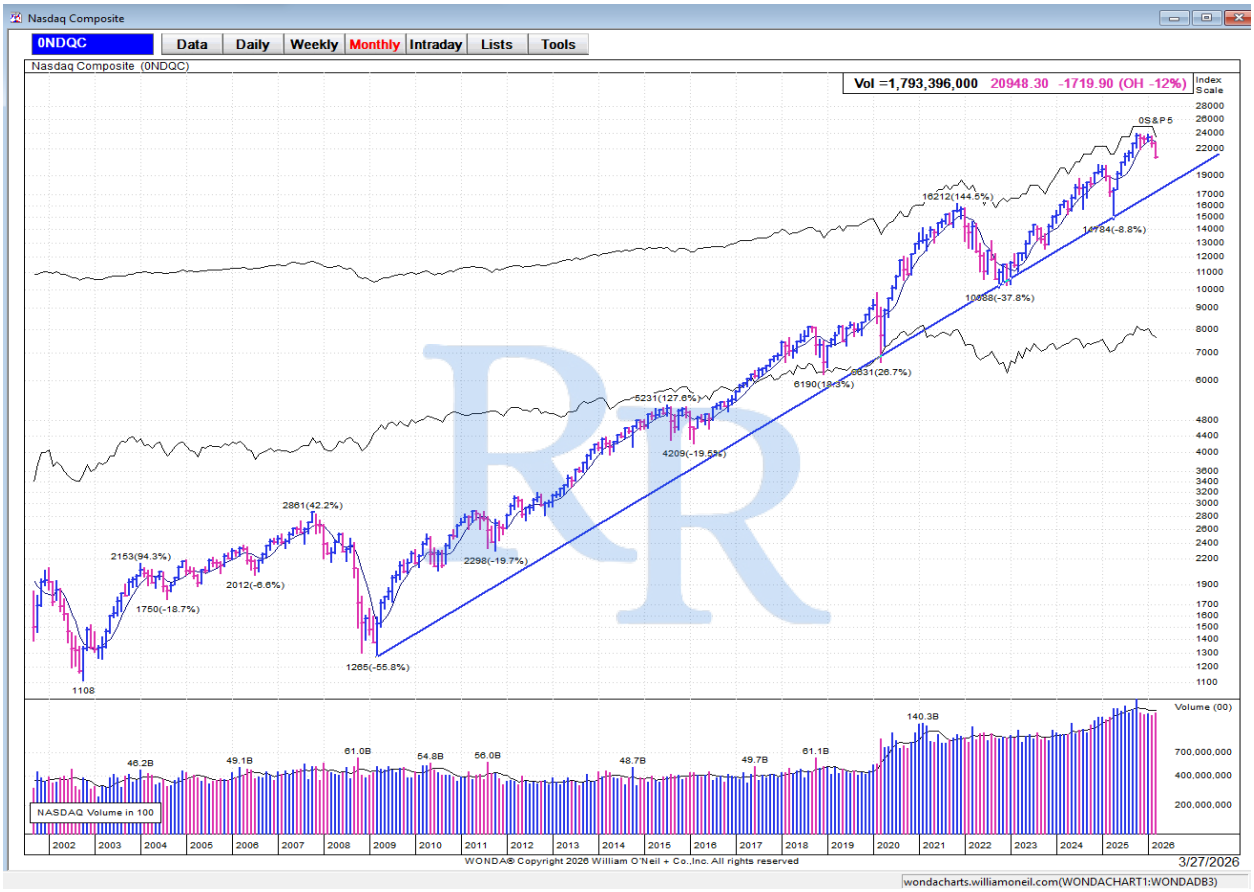

Distribution count:

***Please note that the short-term temperature can change at any moment, and I have the least confidence in this time frame.**

Intermediate-term Trend 4 weeks to 5 months (3/10)

Long-term Trend 6+ month Trend is up: Bullish (3.5/10)

Regardless of what the market does in the next few months, I am very confident that it will be significantly higher in 12 to 18 months!!!!!!!!!!!!!!!!!!!!!! I can't believe we are going to get another opportunity to perform like 2024!!!!!!!!!!

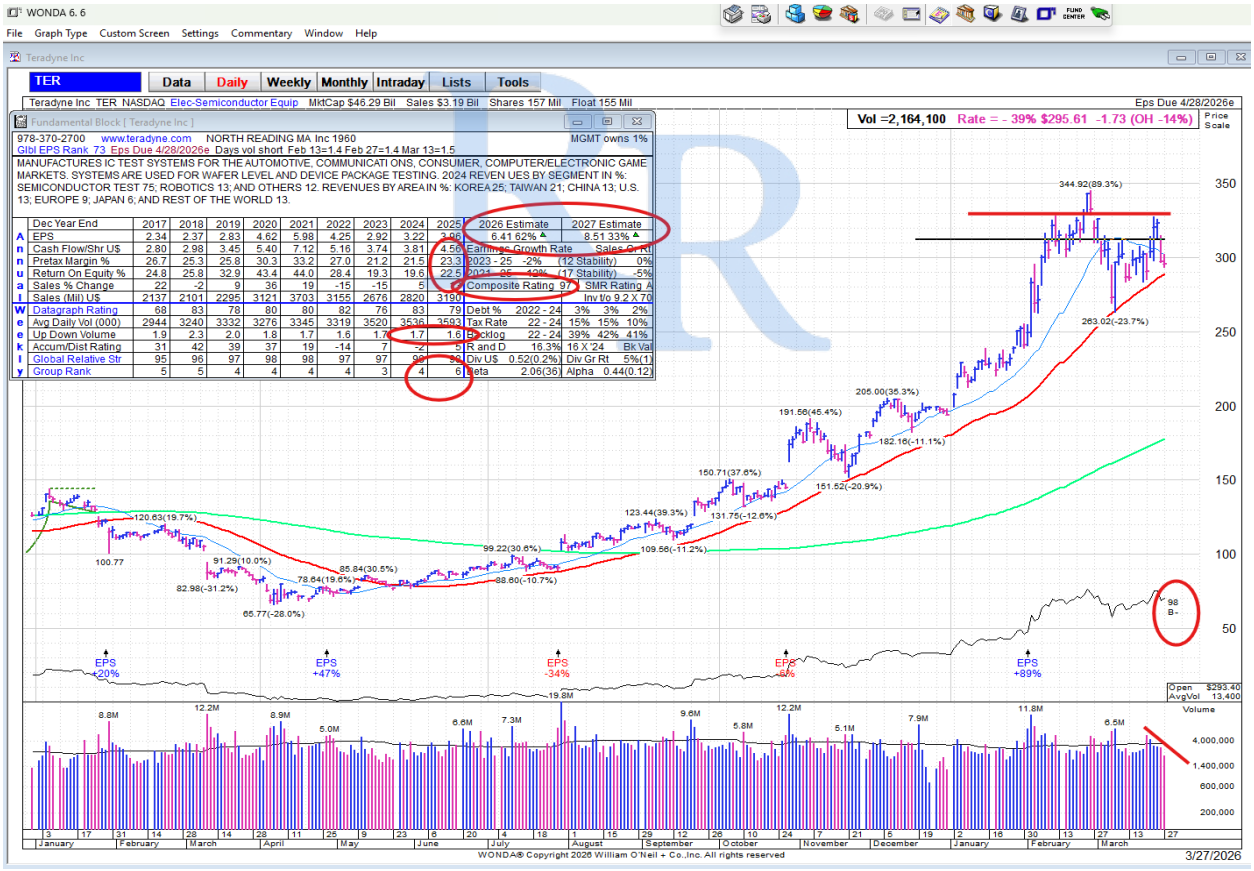

NASDAQ: Although it remains in an obvious 15-year bull trend, we could see a very damaging correction just to test the long-term uptrend. CAUTION!

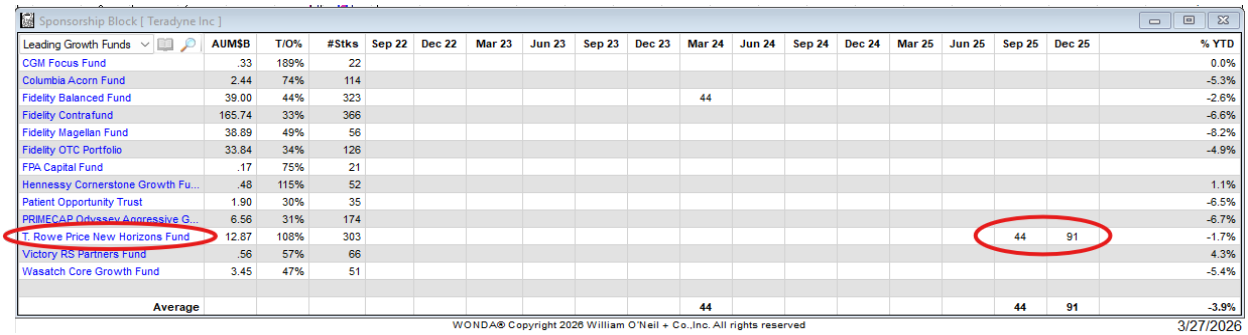

▼ Best Actionable Ideas

This list is only to be utilized when the Market is in an uptrend. Ideas are only actionable at or above pivot points on significant increases in volume.

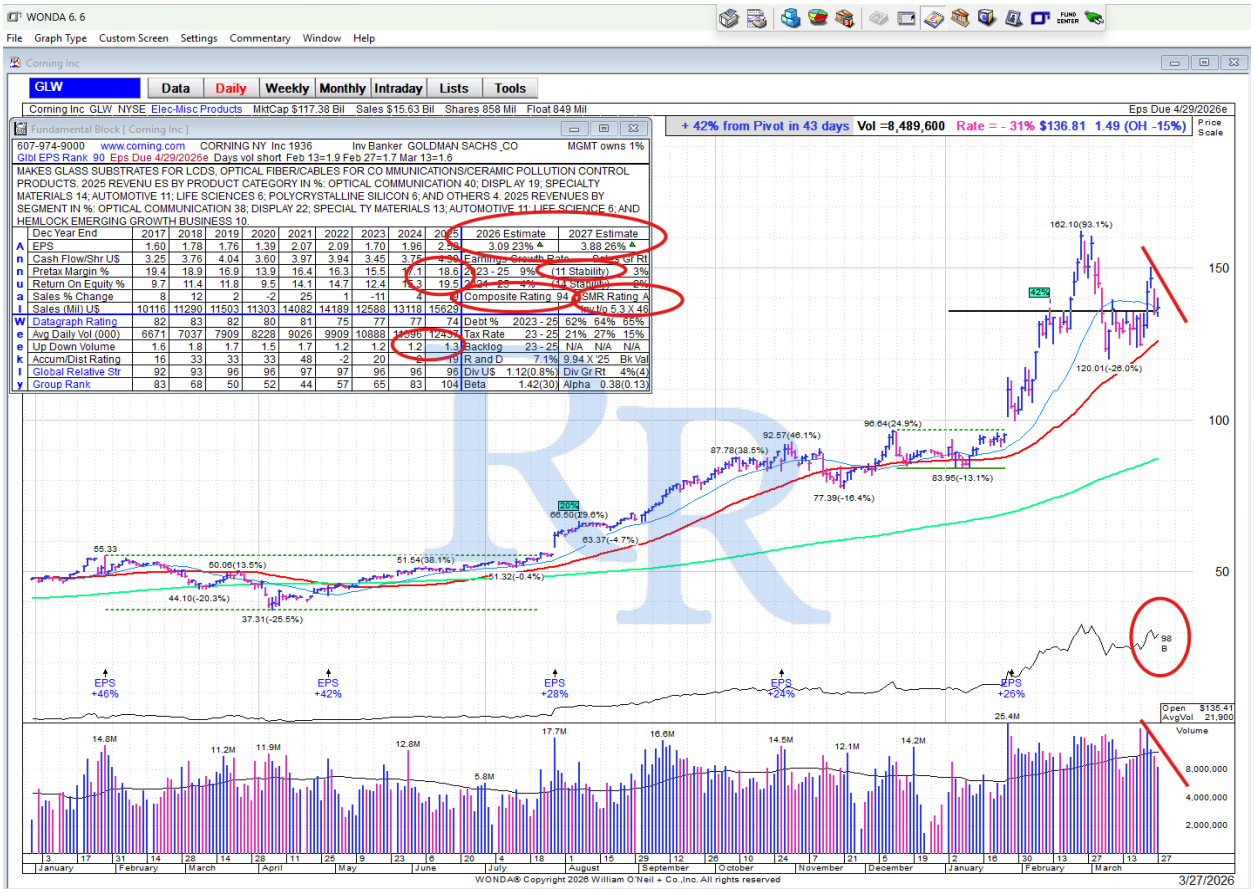

The market has turned so ugly, I am reluctant to give any best ideas BUT, we *must* keep our watch/buy lists fresh as the trend can turn up anytime in as little as three days.

TER really has it all: robotics fundamentals, great liquidity and stellar financial metrics. Note volume dried up last Thursday and Friday as the general market was pummeled. Pivot over $327.55ish.

T Rowe has been building a position.

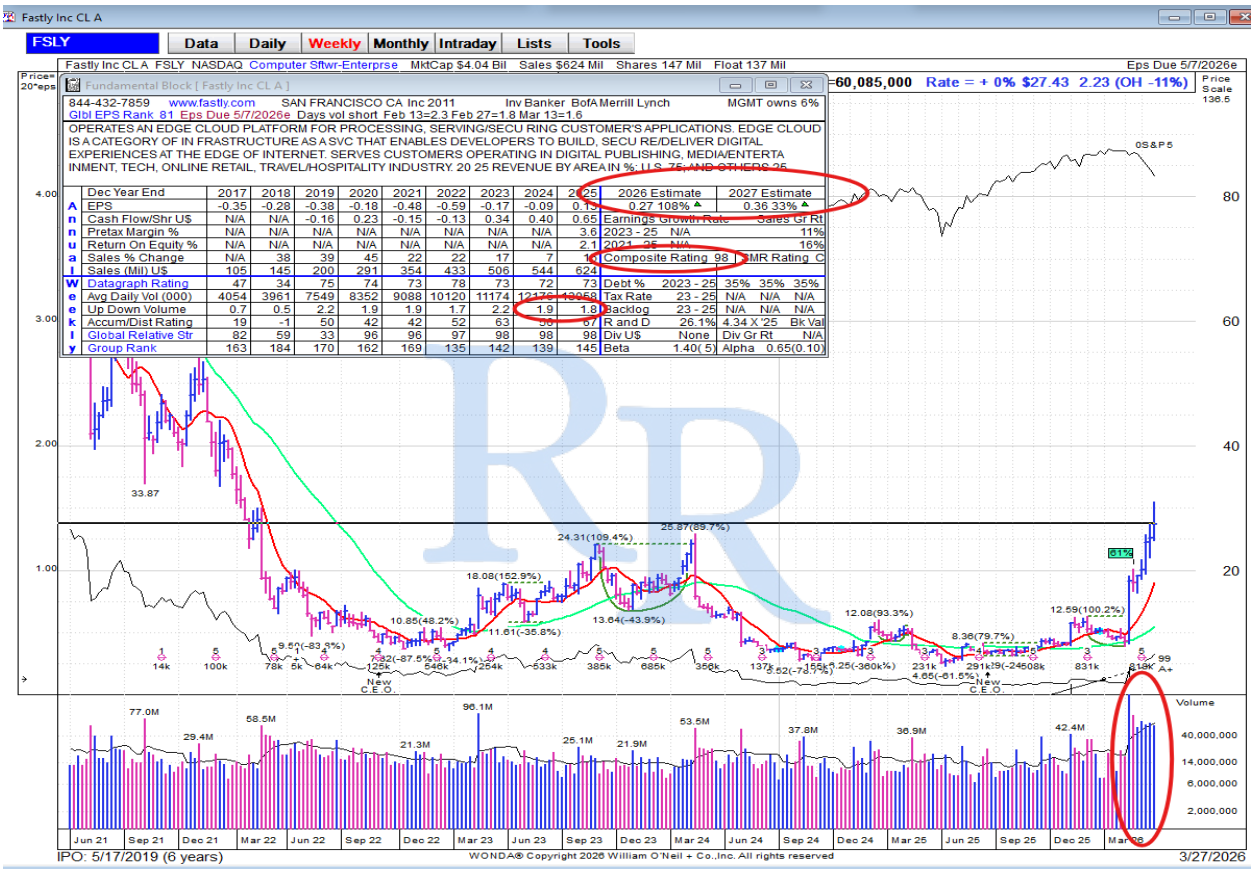

GLW: CRDO has suffered as data centers have been moving to fiber connectivity. GLW was really good to us early in 2026, and it looks to be set up again. I am a big fan of the +18.6 pre-tax margins and +19.5% ROE with #11 stability. Note volume dried up last Thursday and Friday. Pivot over $150.00.

GLW: FIDO just started positions in three funds.

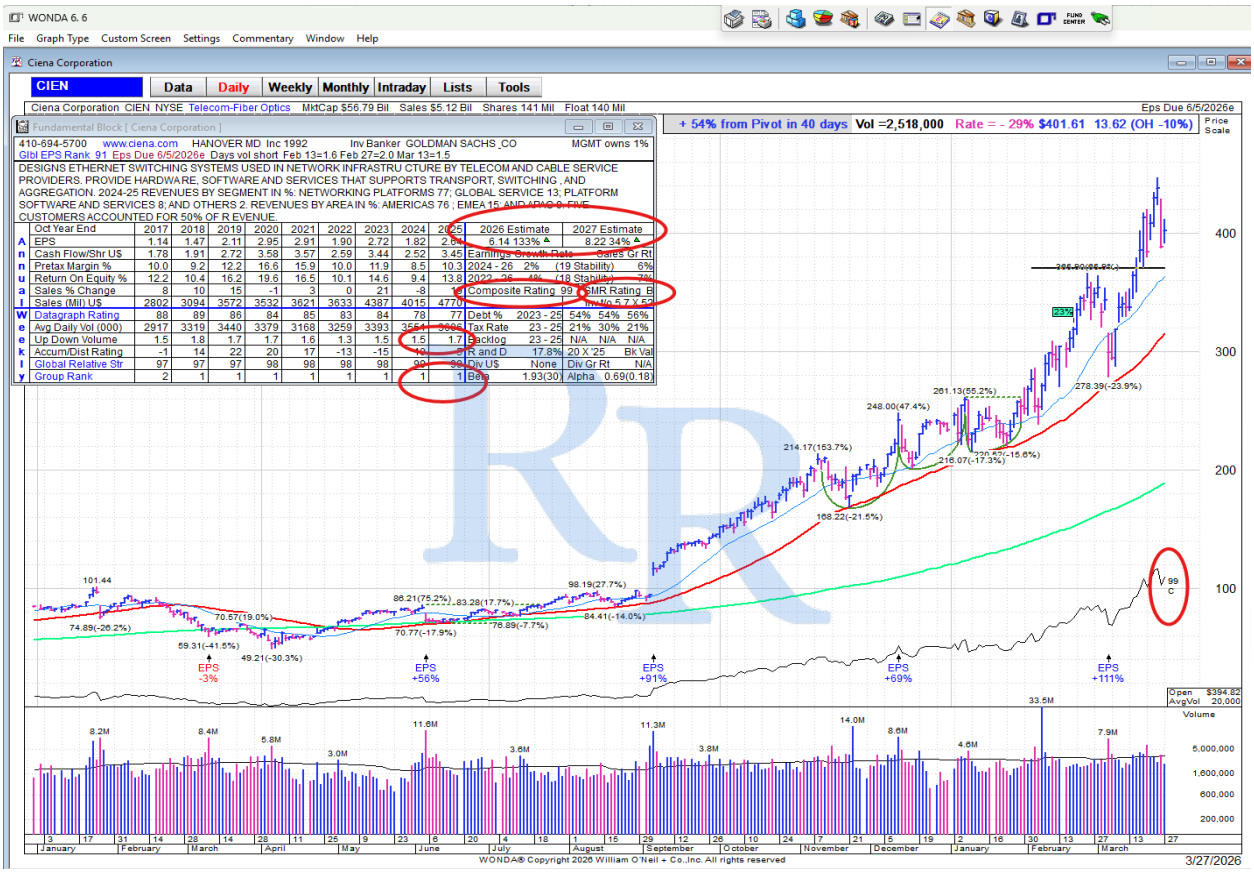

FSLY has been rocking higher against an *ugly* tape; note the Wall of Blue Volume Accumulation (WOBVA). At some point, it will start to digest, possibly the general market downtrend will cause it, but regardless, I would wait for a digestion. Don't chase extended stocks.

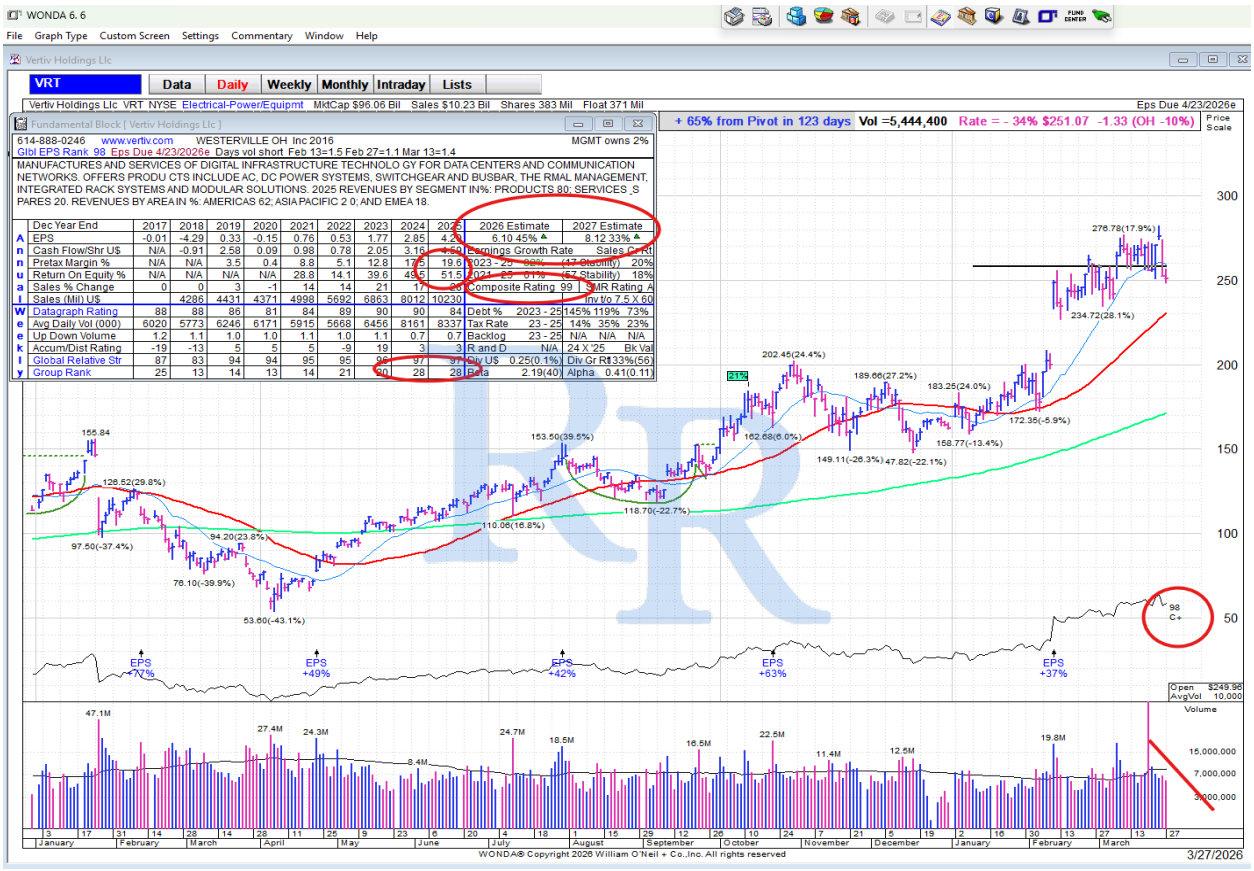

SATS is one of the few names in a base. Last week's breakout attempt failed, but the base has not been destroyed yet. We will see if SATS will be the trout that can swim up a waterfall.

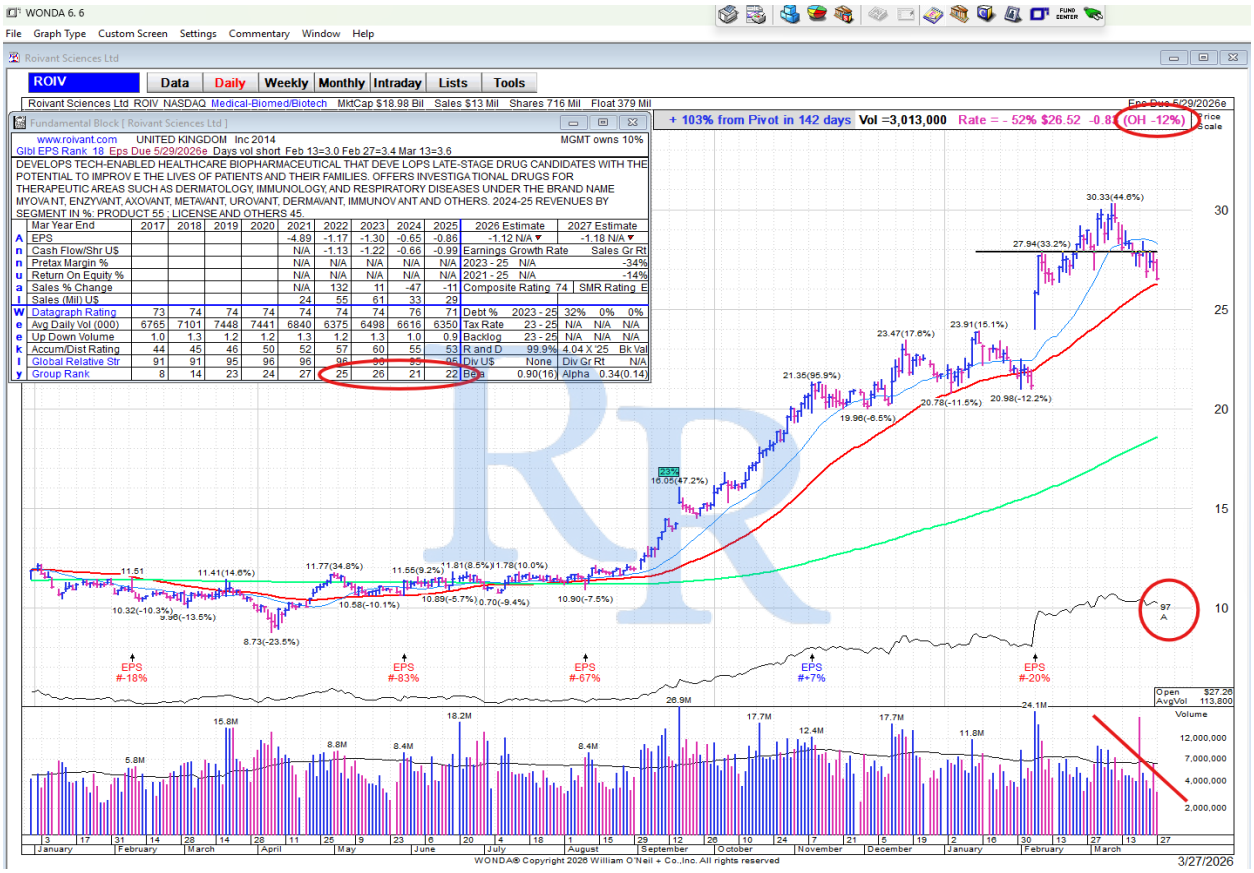

WDC is holding up a lot better than SNDK and so far, holding the 50DSMA. WDC has overall spectacular fundamental metrics. Its shallow digestion does not yet demand a new base.

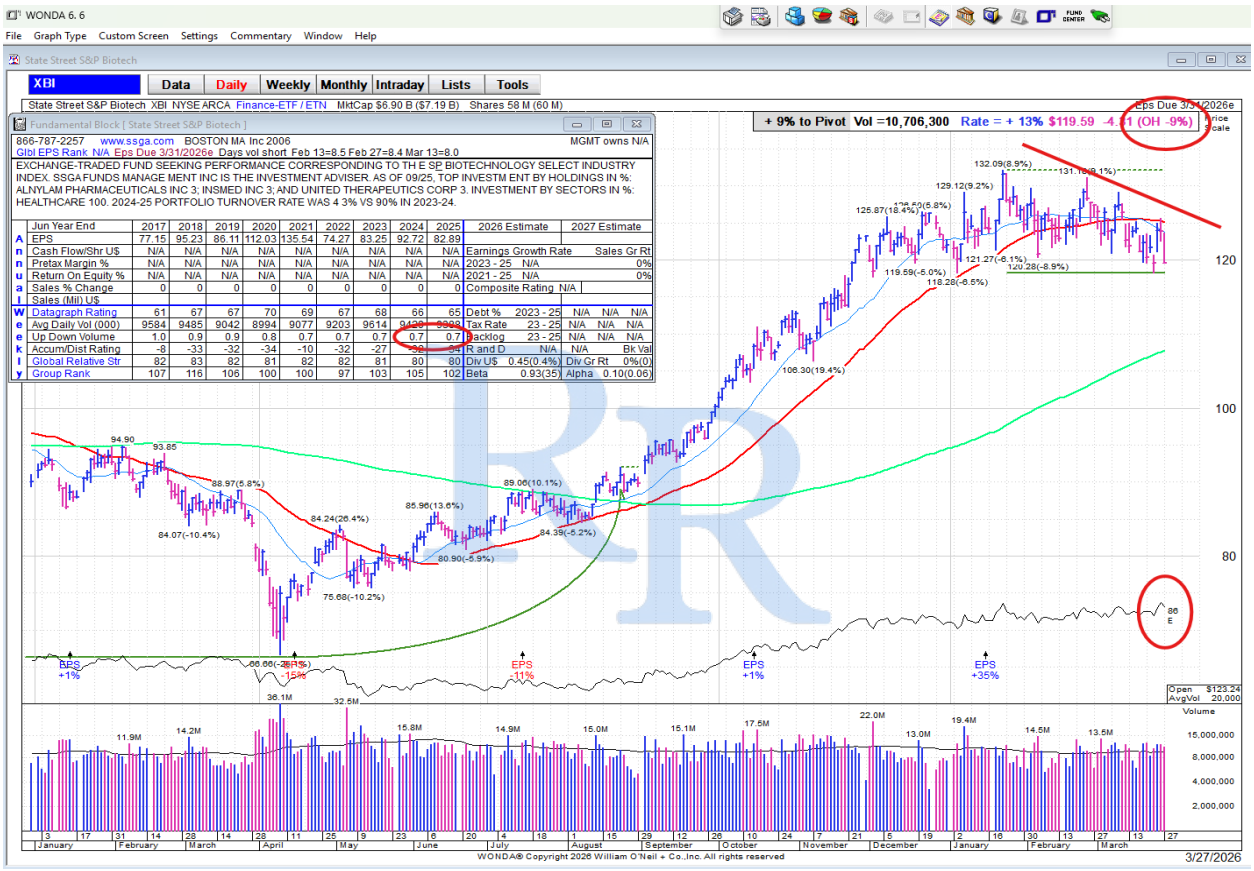

CIEN has been giving us WOW action despite last Thursday's -11 hammering, it was, *amazingly*, up on Friday against a brutal general market sell off. It's very extended now, but must be monitored for consideration when the tape improves.

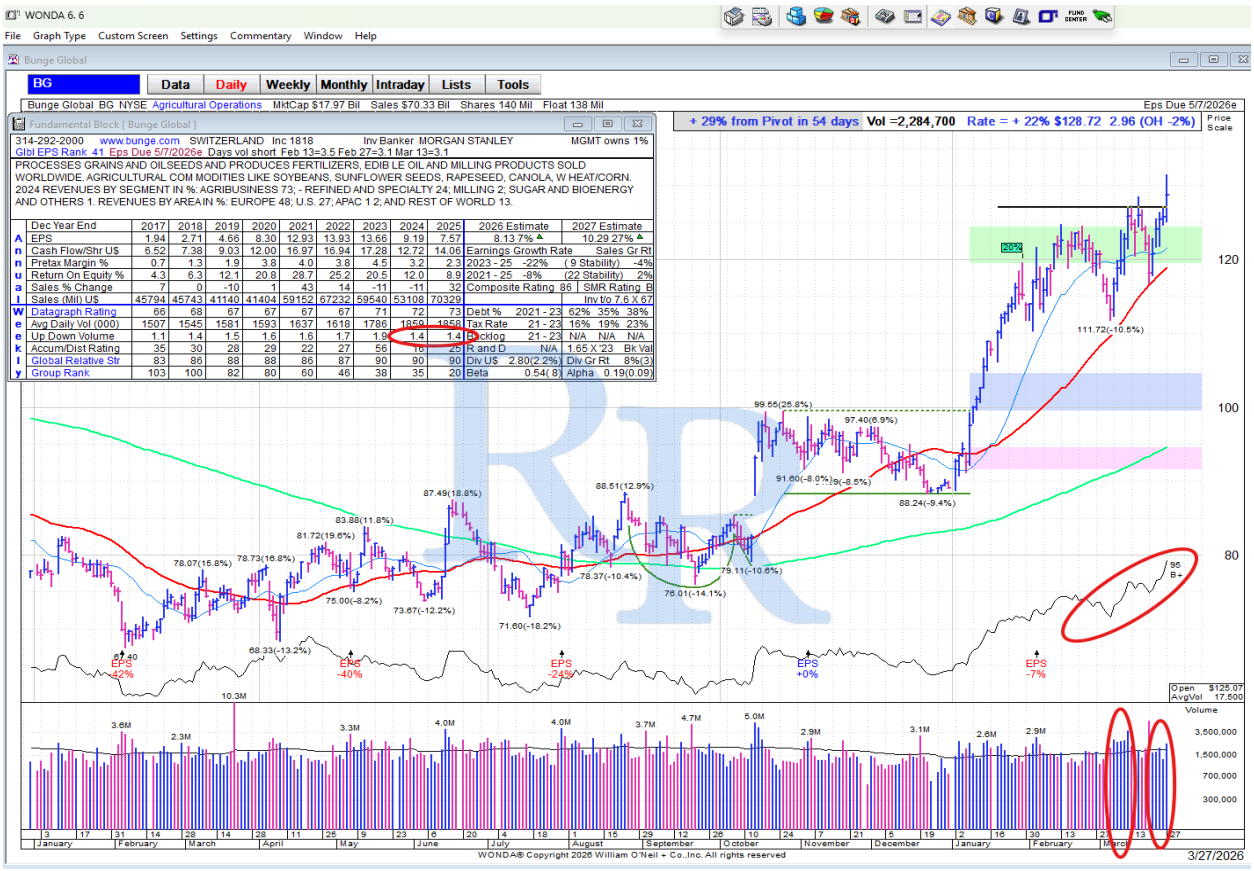

VRT is one of my favorites, 99 comp, and incredibly strong up to this point. The same for GEV.

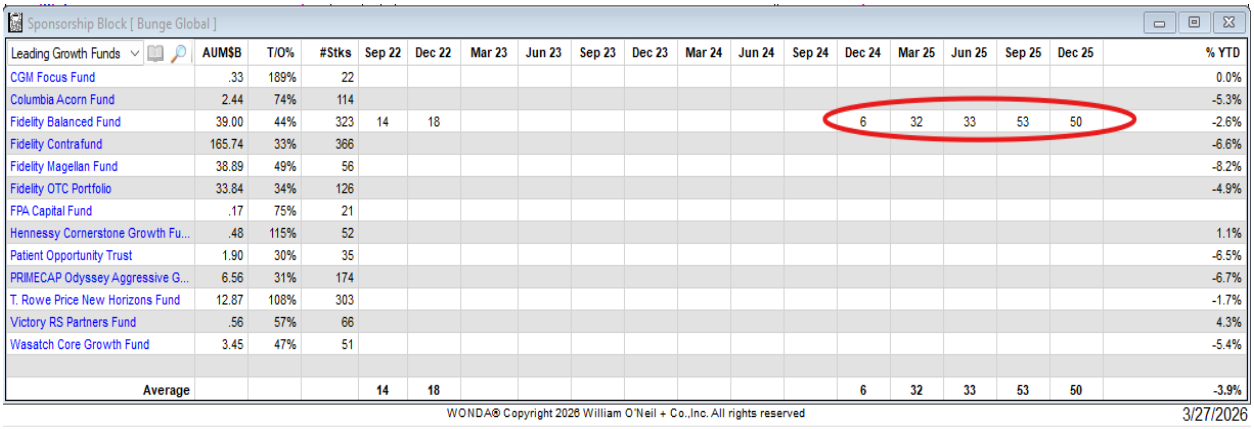

ROIV: Biotech is one group that has held up really well so far, #22. Note volume has been drying up as it digests.

XBI: I *love* the fundamentals, but it's made a series of lower highs, A/D has declined to E, and U/D is .7. I max hedged, just in case.

BG: It has been a tough hold, but it won't give up. Note the leading/confirming 95RS lines trajectory.

FIDO is in BG.

▼ Crypto

On December 15, 2018, Matt D'Souza said: "Many skeptics and speculators claim Bitcoin is dead purely based on its deep and volatile market correction." In 2002, similar assertions were made about CSCO, AAPL, and AMZN, which were also pronounced "dead" because there was too much focus on stock prices rather than ecosystem growth, adoption rates, and improving fundamentals. From those Dot-Com Bubble "dead lows" to present trading levels, these stocks have returned roughly 390%, 34,000%, and 32,000%, respectively.

BTC—We are presently in a macro-correction, and it's uncertain how much lower prices will go. Many of the best stocks, such as Facebook and Nvidia, have already experienced 40-55%+ corrections, yet no one is pronouncing the death of social media or the end of Compute/AI. Of course, these companies are fundamentally sounder and more mature than the Bitcoin network.

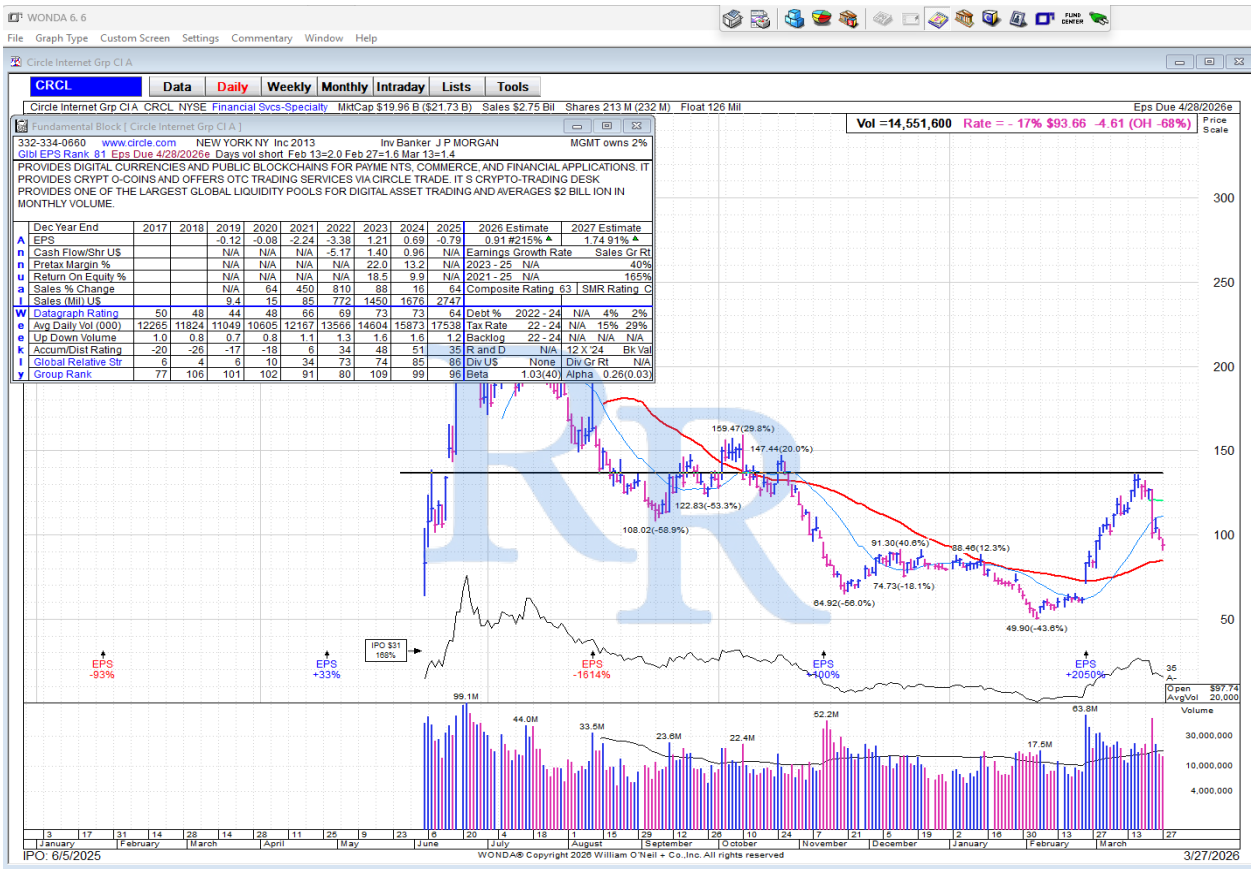

***********The point simply being that predicting the long-term future of a technology solely based on price movements is unwise.**********

Just as "Bitcoin becoming the world currency and replacing Visa" at $20,000 was foolish, "Bitcoin is dead" at $66,500 is equally as foolish.

BTC: If I were personally not already very long BTC and the whole crypto space, I would start dollar-cost averaging in. Price can definitely make lower lows, but based on history and the maturity of the space, the bulk of the damage has passed. I would NOT go all in here, but I would be building with a 2-year outlook.

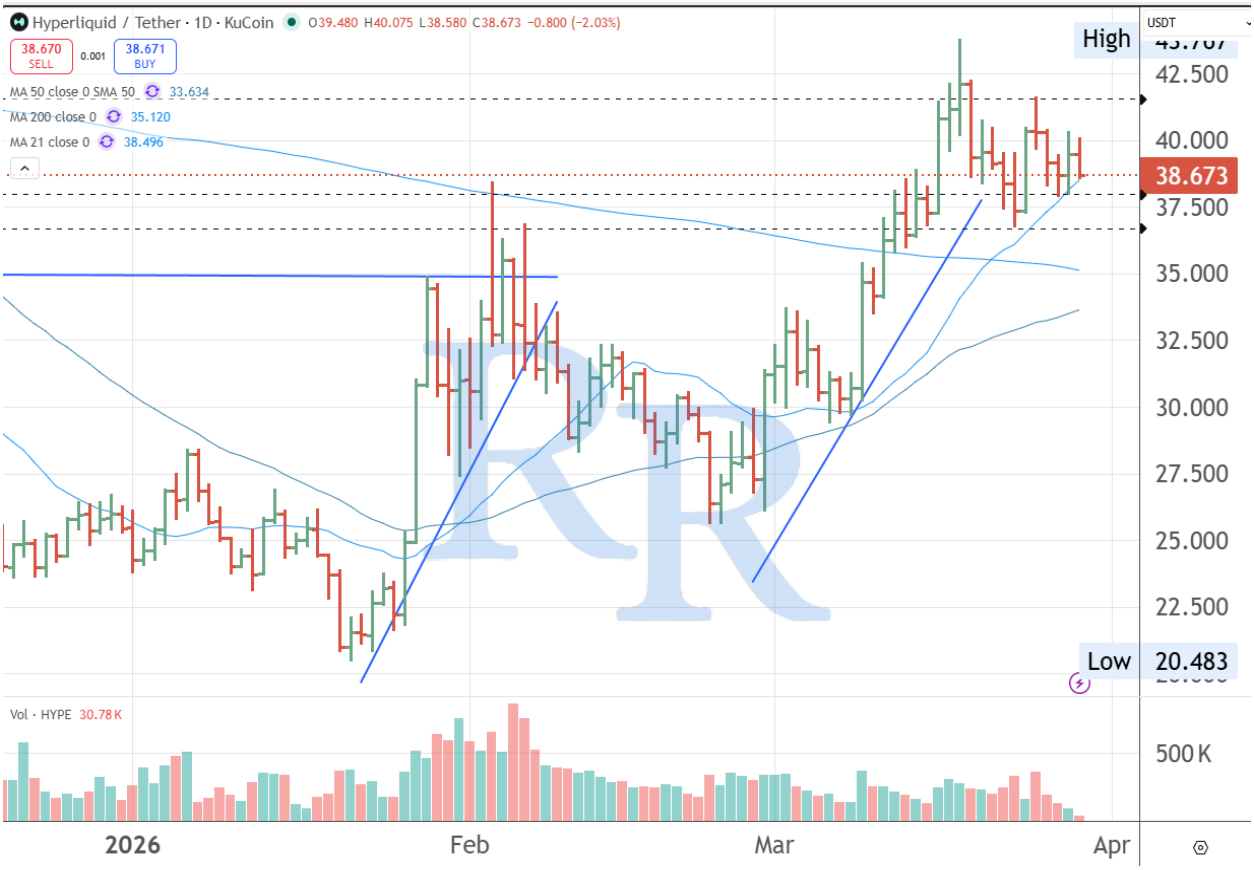

Crypto prices have totally diverged from fundamentals, but at some point, that is going to change, and smart investors who took advantage of cheap prices should profit handsomely. This is the exact opposite of a trend following strategy.

CRCL: The big banks killed yield on stablecoins, but that's not stopping the insane rate of adoption, and soon enough, stablecoins will have yield.

https://www.cnbc.com/2026/03/26/fannie-mae-accepts-first-crypto-backed-mortgage-product.html

HPYE is where the RS is!!!!!!!!!!!!!!!!!!!!!!

PURR is a Hyperliquid D.A.T. pivot over $6.75.

The market for tokenized equities went from $32 million to nearly a billion in a single year.

The institutions that run the current system are the ones rebuilding it. McKinsey projects $2-4 trillion in tokenized assets by 2030. Citigroup says $5 trillion. Standard Chartered, on the more extreme ends, says $30 trillion by 2034.

These are some of the most conservative institutions in finance and they're projecting a 1000x increase in tokenized assets within five years.

The potential scale of tokenization adoption hinges on multiple factors.

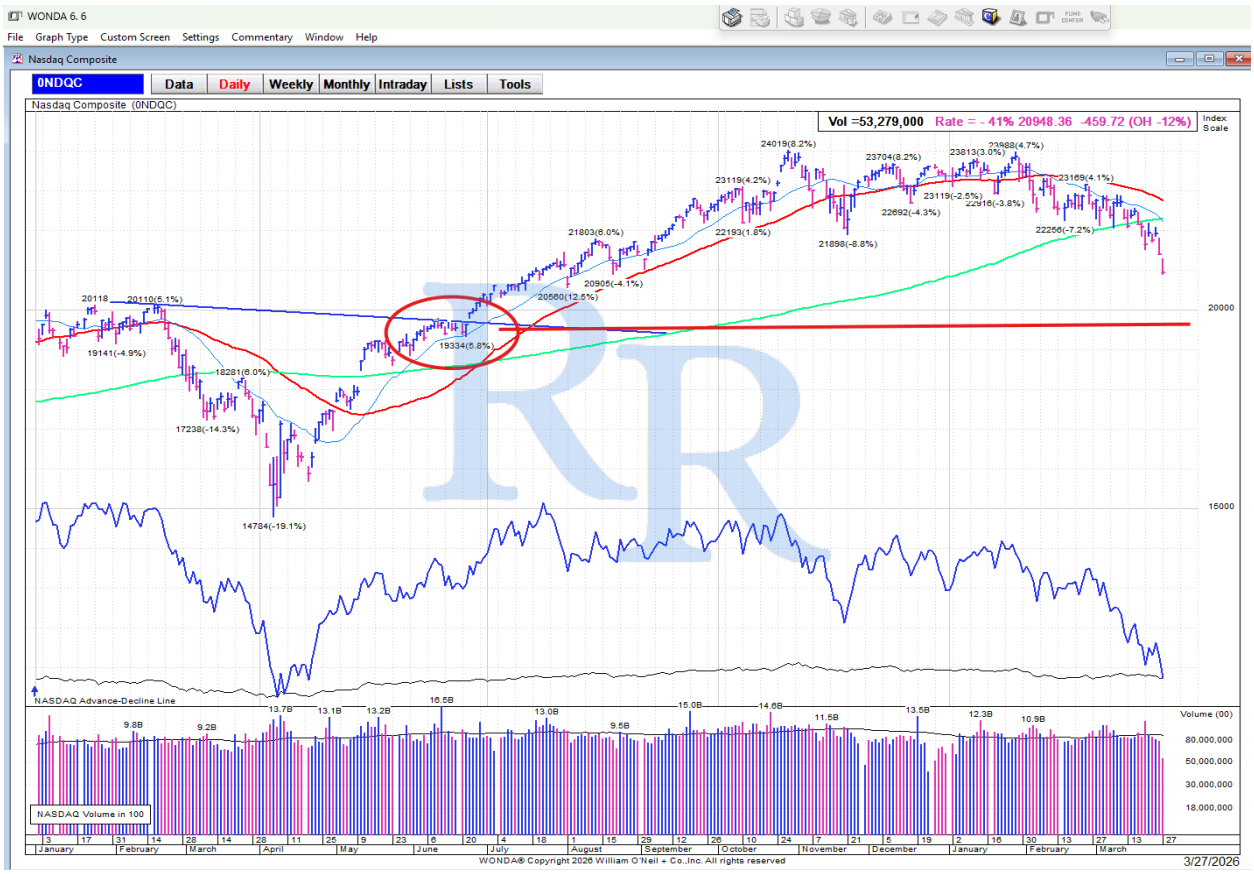

Forecasts of three potential adoption scenarios, 2030, nonexhaustive

	Slower adoption	Base scenario	Accelerated adoption
Potential 2030 tokenized market capitalization, $ trillion	~0.8	~1.9	~3.8
Regulation	Regulatory challenges remain high	Regional disparities exist, but regulatory clarity is increasing	Permissive regulation
Infrastructure and enablers	Inadequate infrastructure to support tokenization, lack of enablers (eg, institutional-grade stablecoin)	Infrastructure reaches adequate maturity, required enablers emerge	Infrastructure and enablers reach institutional-grade maturity, available at scale
Market demand	No solution to cold start problem limits demand for tokenization	Some assets tokenized at scale catalyzed by larger players	Cold start problem is overcome by industry-wide collaboration
Risk and reputation	Systemic risk event occurs and limits or discourages adoption	Limited security issues or systemic risk events	No major security issues or systemic risk events occur

McKinsey & Company

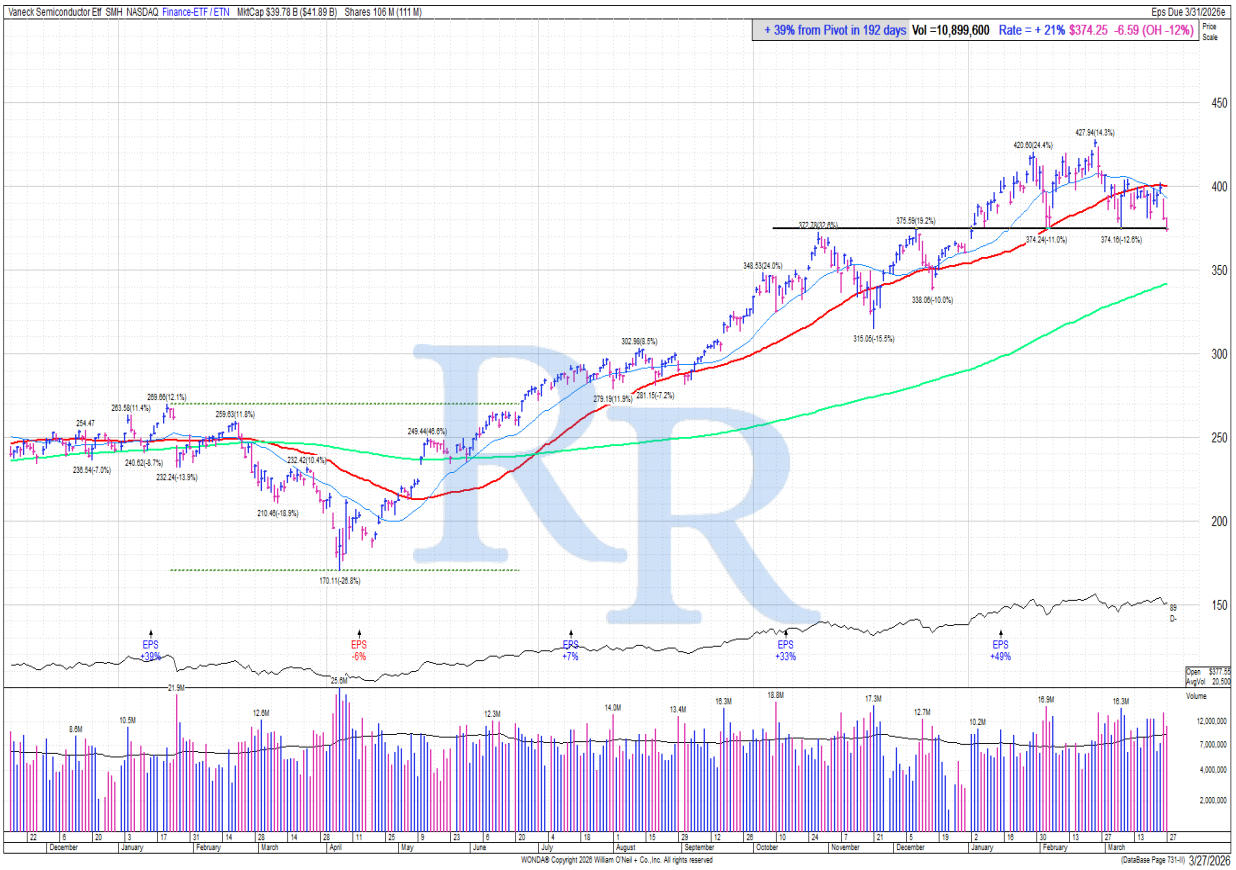

- The NYSE is building a tokenized securities platform.
- Nasdaq has filed with the SEC to tokenize every listed stock.
- The DTCC is creating blockchain-based digital twins of securities it already holds.
- Robinhood, Coinbase, and Kraken are already offering tokenized stocks.

▼ Market, Indexes, Indicators, and Dominant Factor Charts

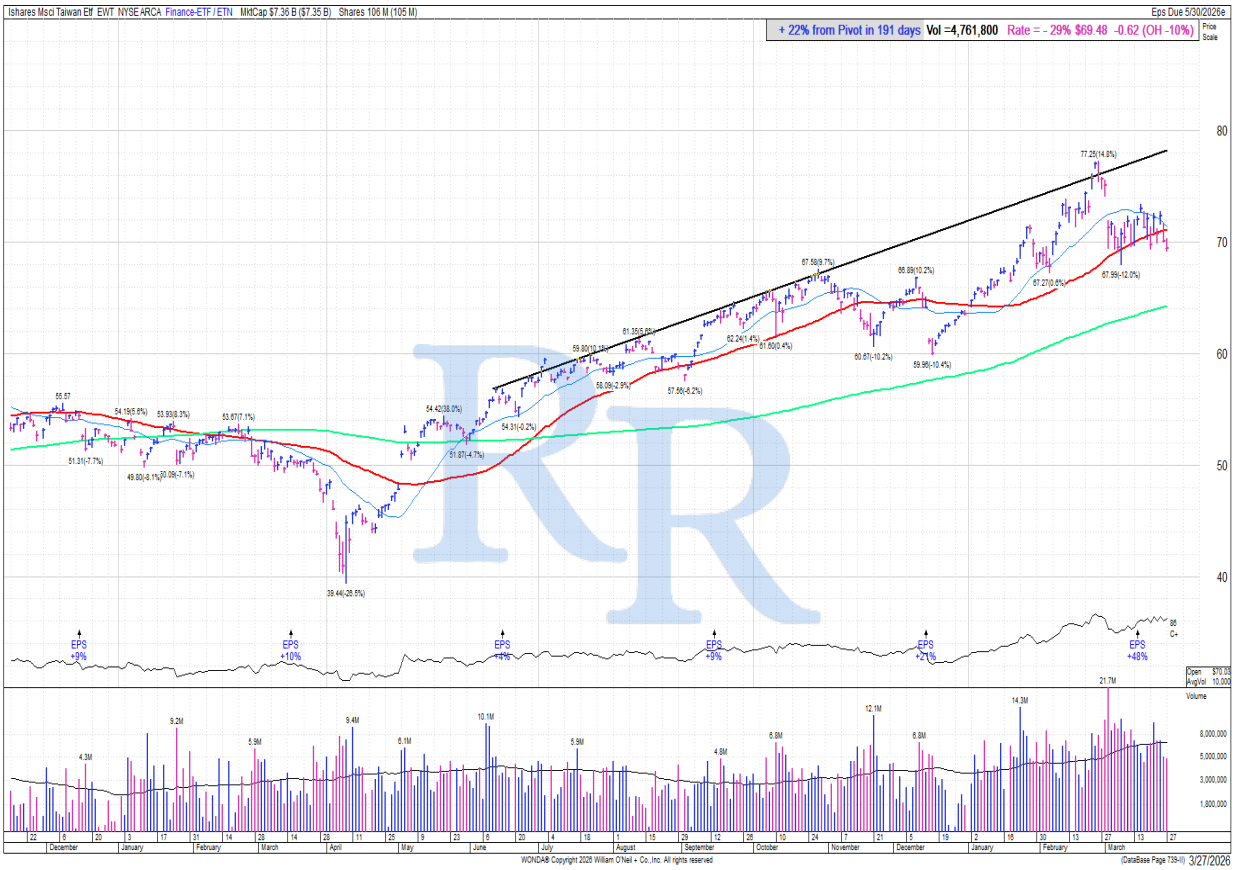

NASDAQ is short-term oversold, so a counter-trend bounce could materialize at any time.

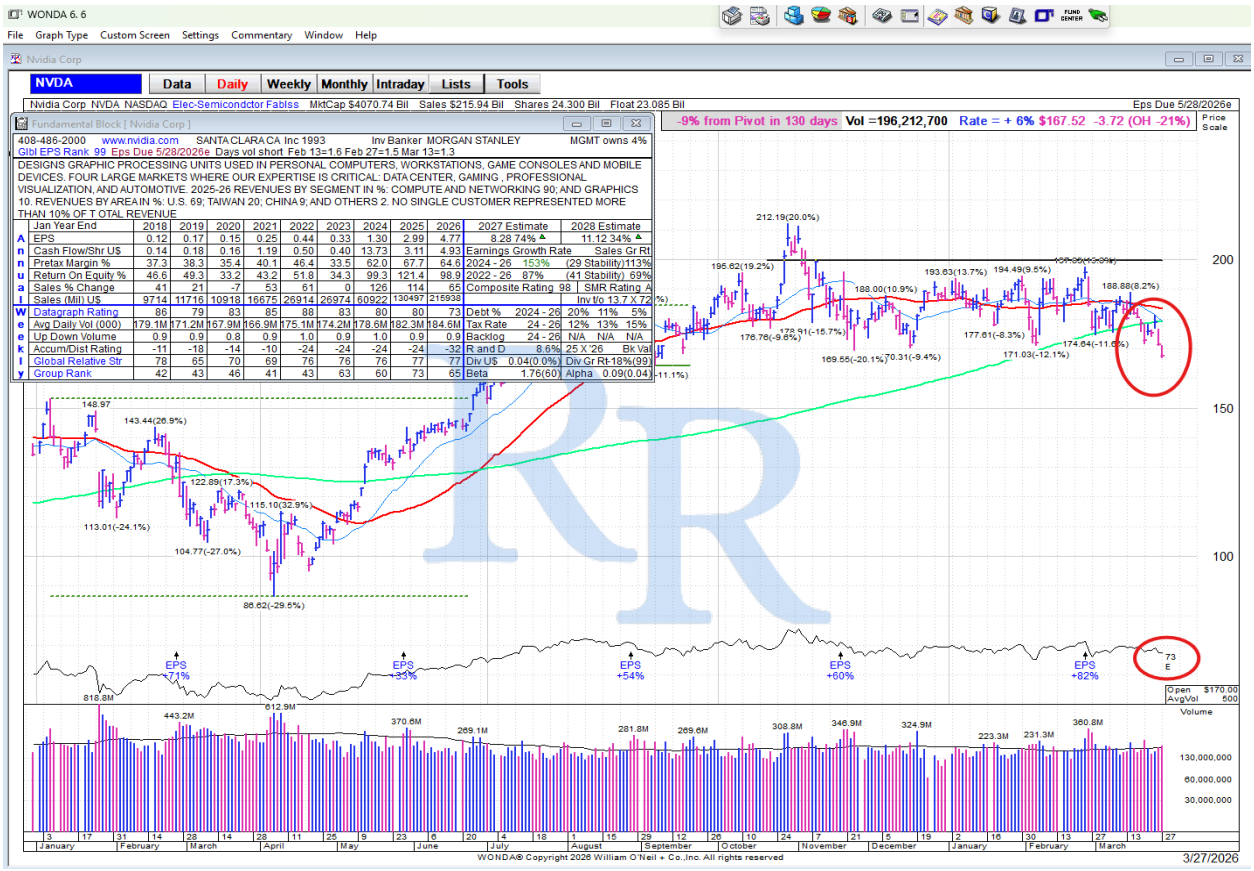

We are in a breaking news-driven whipsaw market within an overall down trend. For me, it's a perfect opportunity to sell longs or shorts, big gap-up opens, and counter-trend rallies. No market goes straight up or straight down; all long-term trends have counter-trend rallies. The current market has become a trader's paradise. Caution: Because of bullish headline risk, I would not short into down markets. Without a high-volume panic, -3% -4% down day washout, I don't expect a bottom. Livermore would be pressing the short side or fishing. Outside of O&G names, equities are a no-go zone for now. The "Golden Goose" would hate to say it, but if, if, if the market accelerates down, $19,500ish, the zone of last June's breakout, is in play.

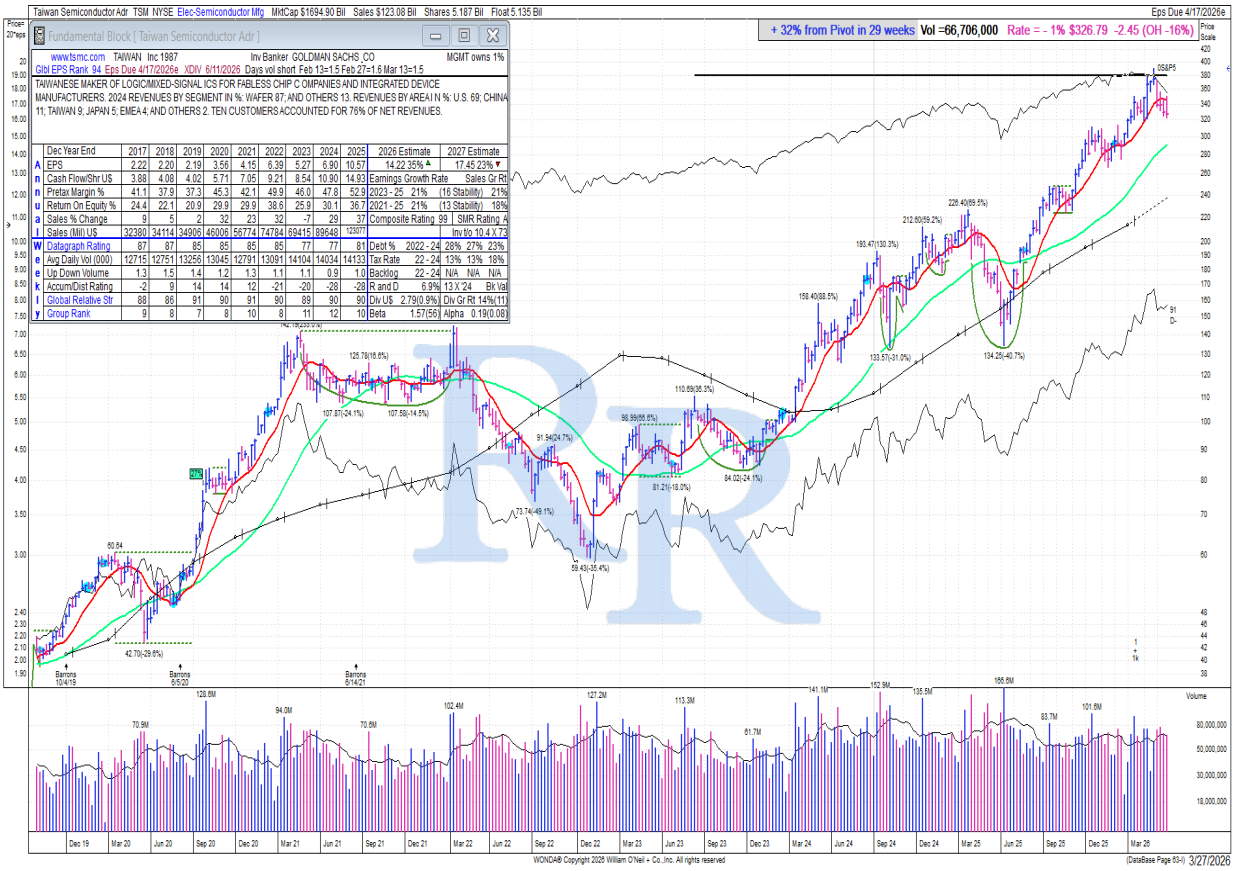

SMH: A move just a few points lower will bring the 200DSMA into play. I have a very speculative bear put spread on. If, if, if SMH breaks $374.00, it could be the trigger for a waterfall break lower in the general indexes. The break lower in IGV could prove insignificant compared to the damage SMH could bring.

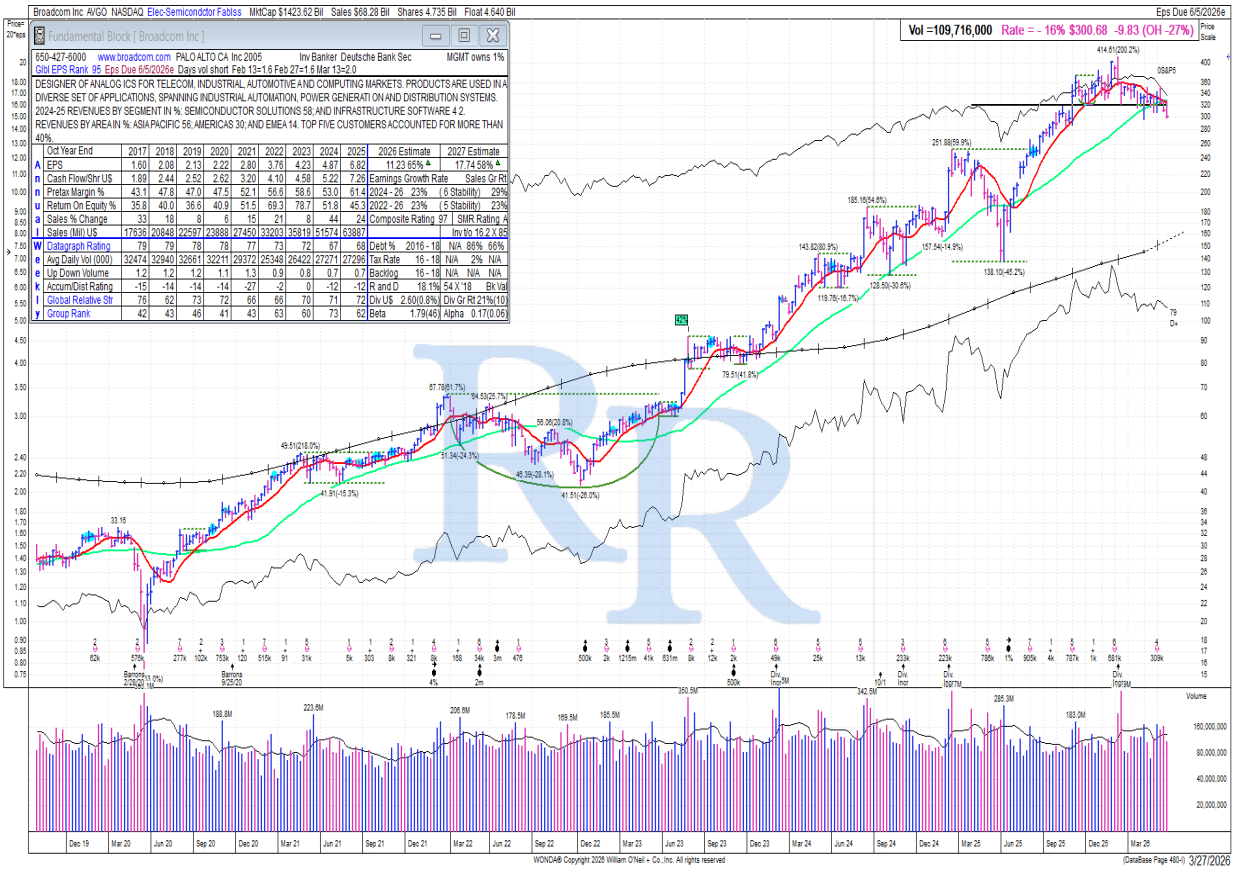

EWT is okay for now, but it's in a precarious position.

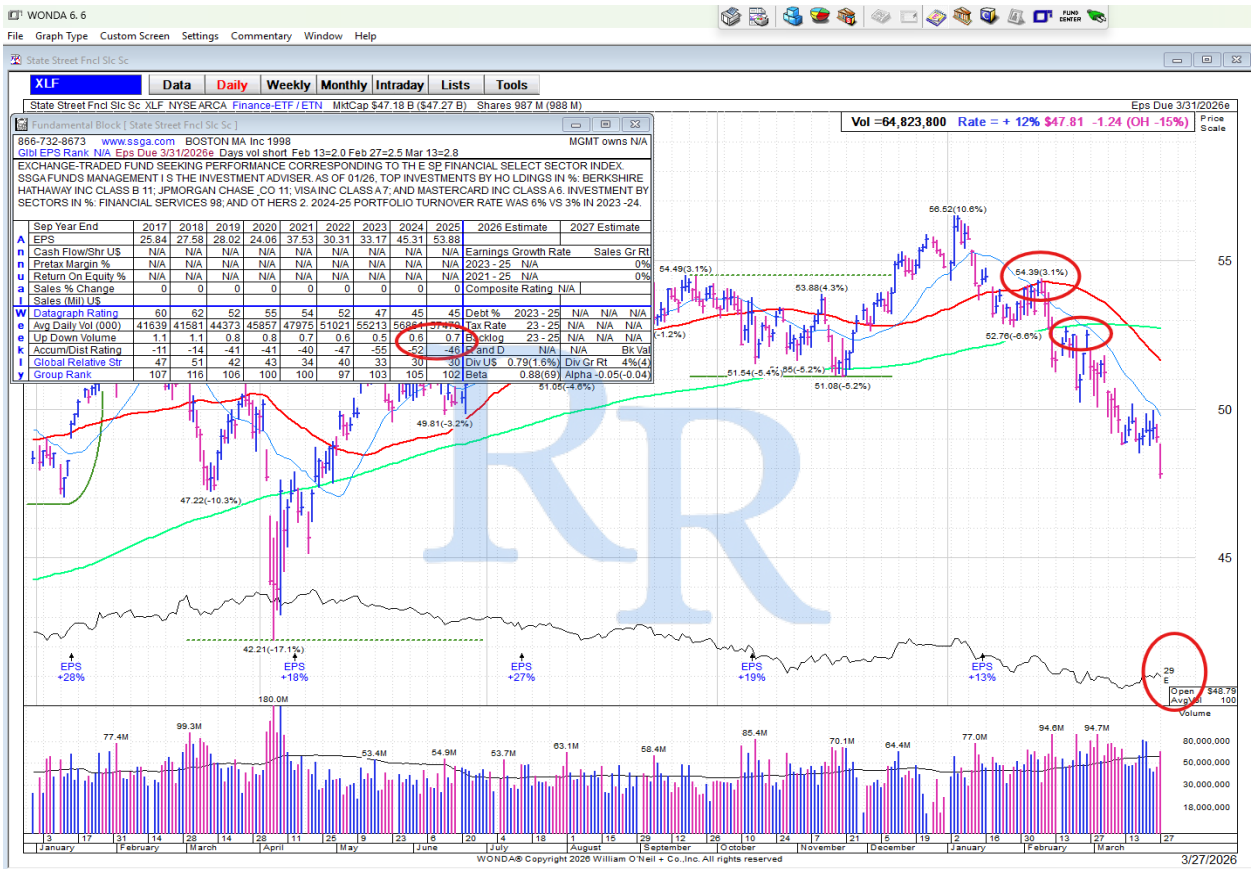

NVDA: The "Mac Daddy" has caught a cold, but it's threatening to morph into pneumonia. Volume did not erupt as it cracked below the 200DSMA, but if it does, look out below. There is limited support until $135ish. As NVDA goes, so will nearly all stocks outside of natural resources. CAUTION!!!!!!!!!!!!!!!!!!!!!!!

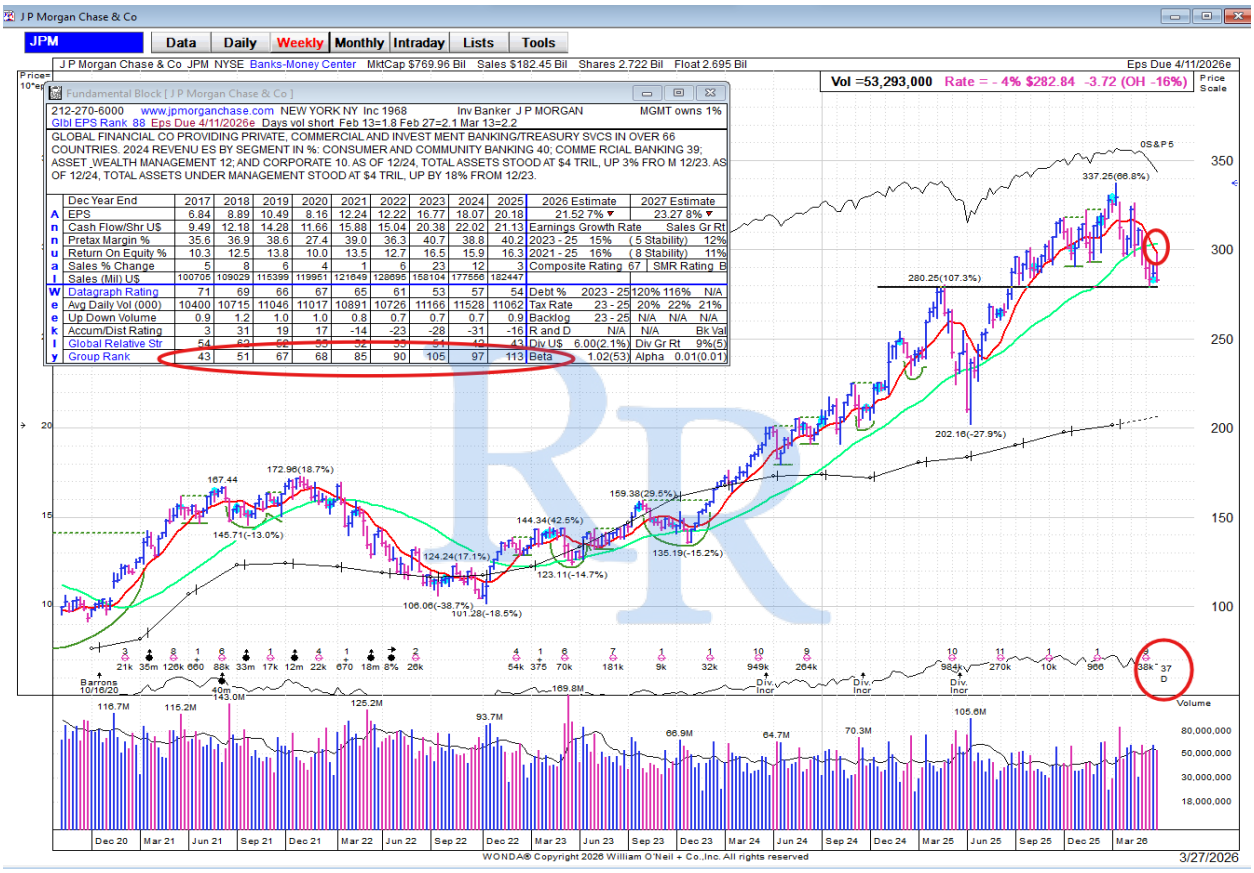

TSM: Four weekly closes below the 10WSMA means it is living below the 10-week.

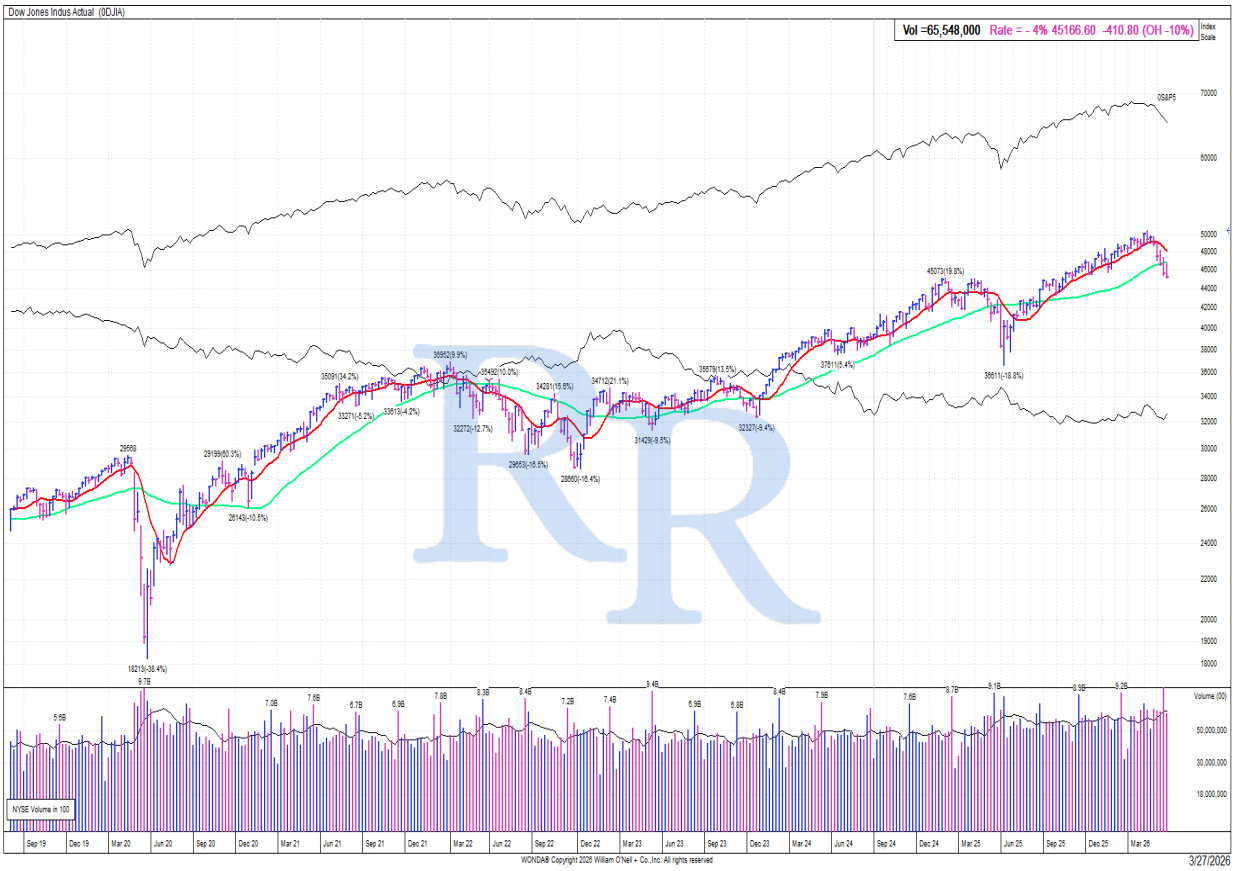

AVGO is straight up *UGLY,* living below the 20WSMA and accelerating lower. LRCX has been getting ragged, as well.

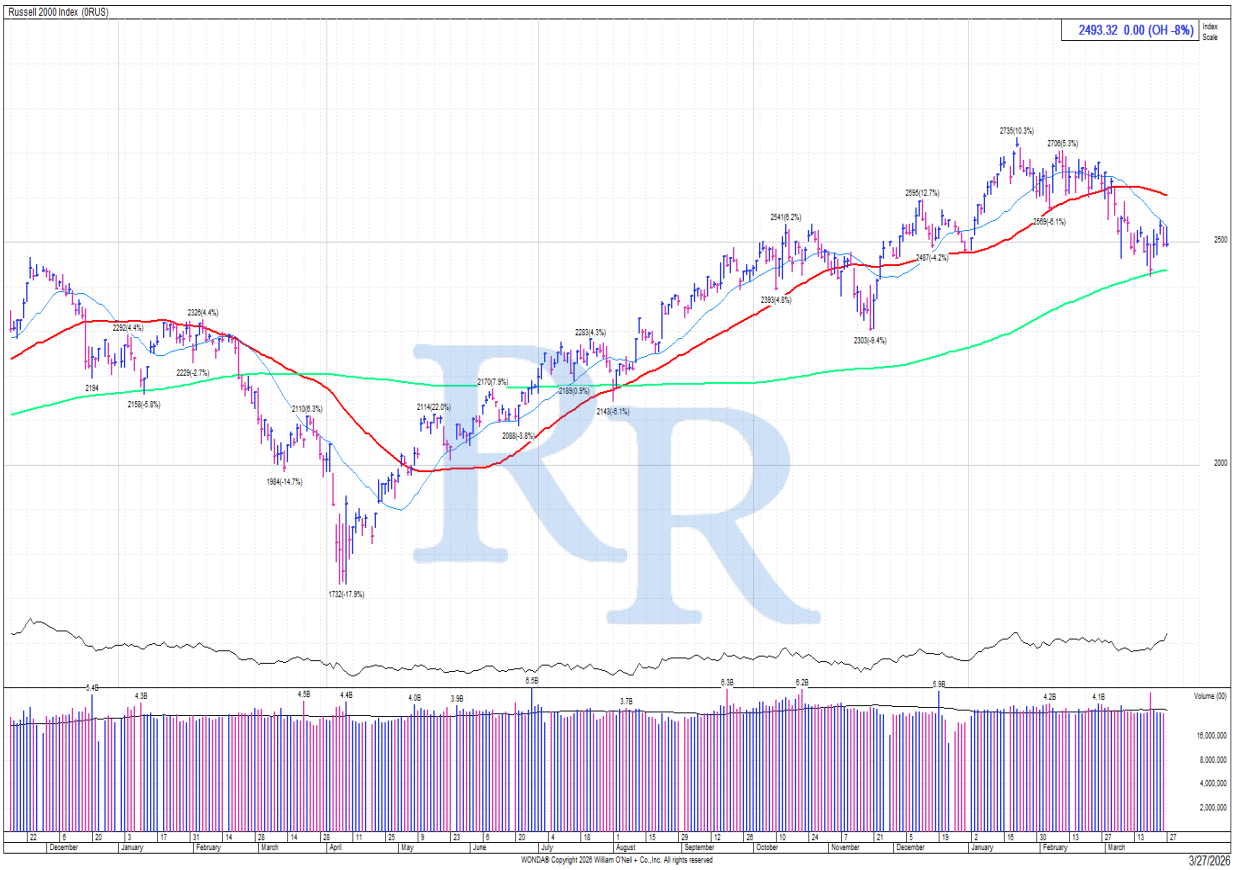

XLF: it's nearly impossible for the general market to rally if the financials aren't at least stable, which is not the case right now. RS29, A/D=E, and Friday was an ugly acceleration. Iran is not the only problem the market is facing.

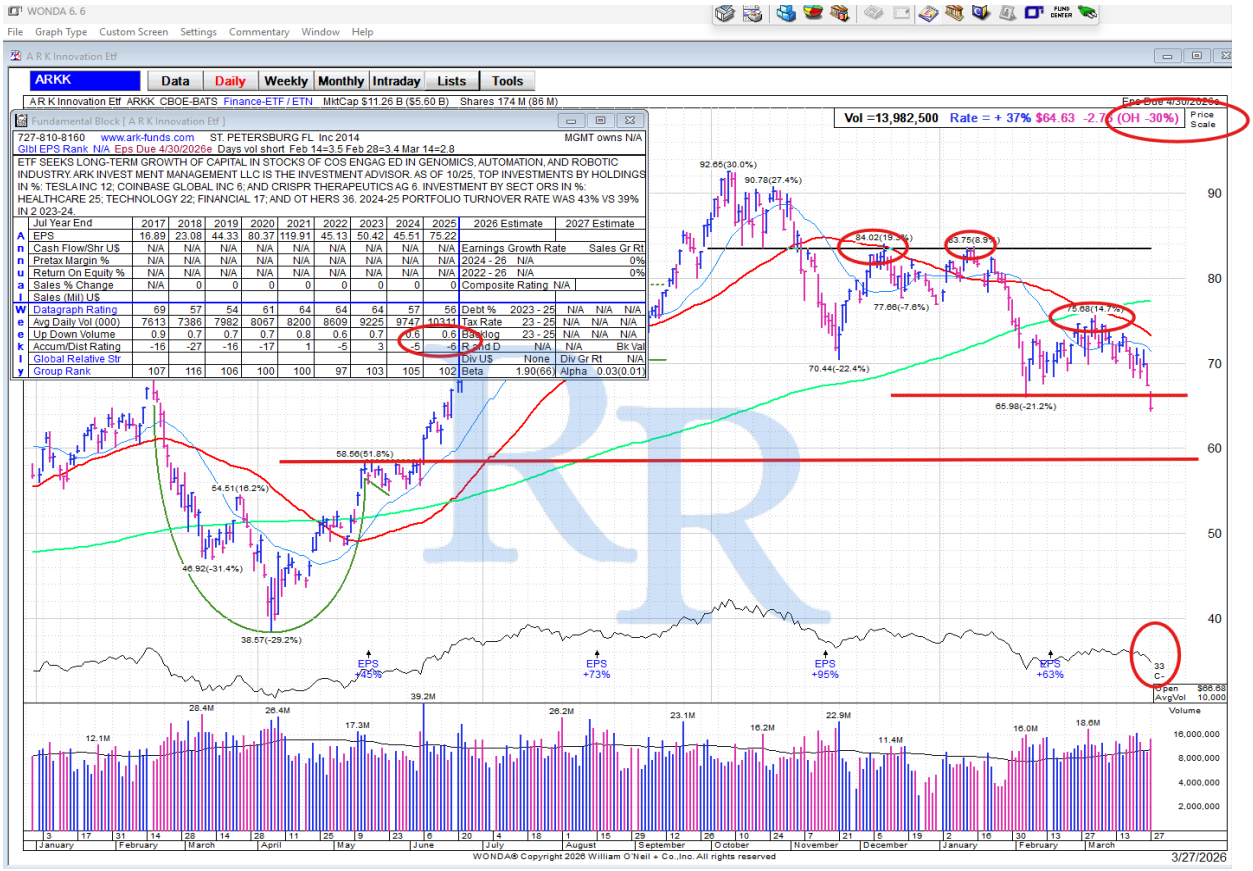

JPM is the NVDA of the of the financial sector. Note the deterioration in group rank from #43 down to #113, 37RS and A/D=D and a hard rejection at the declining 10WSMA. Support starts at $270ish.

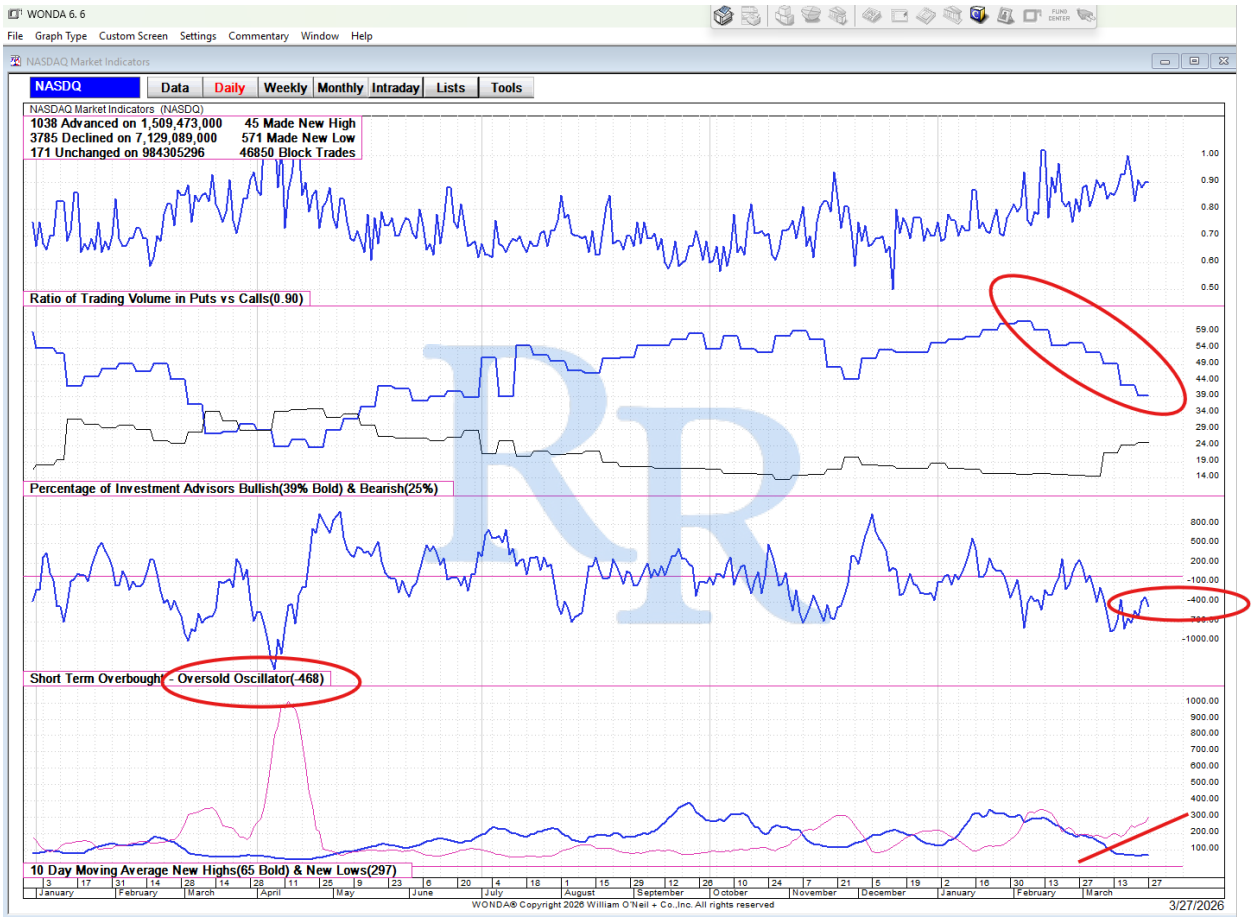

DOW closed below the 20WSMA five weeks in a row.

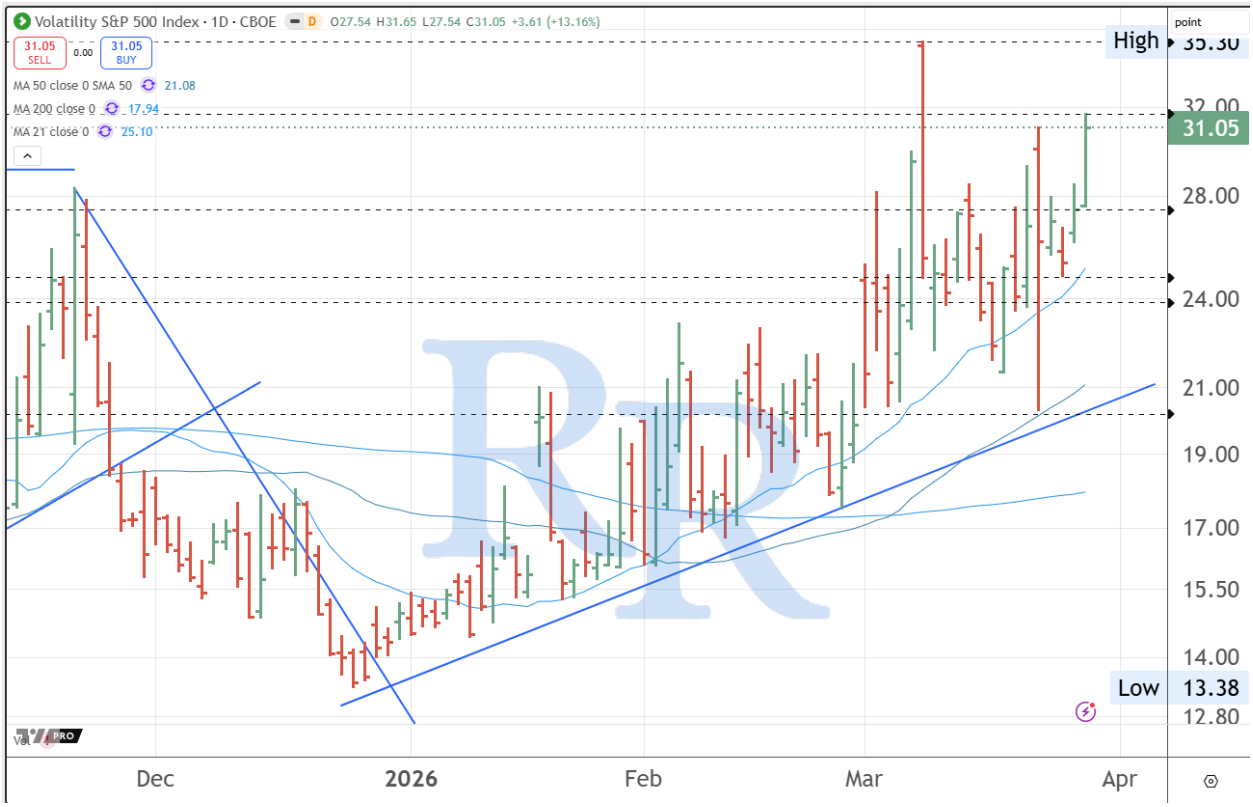

Russell 2000 is only -8% off highs and outperforming the S&P 500, note the rising RS line.

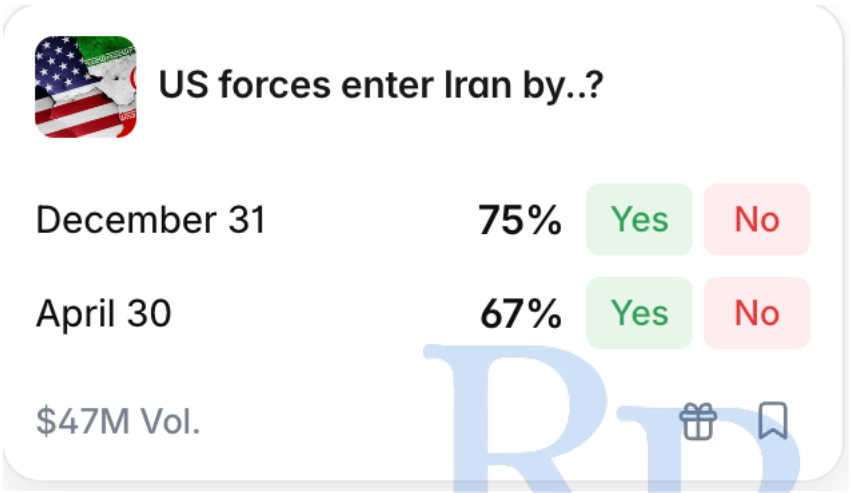

ARKK: Note -30% off highs and getting significant resistance at the declining MAs. Cathie Wood is a great researcher, but has ZERO risk management. That has obviously been a disastrous combination. Next support is at $58.00.

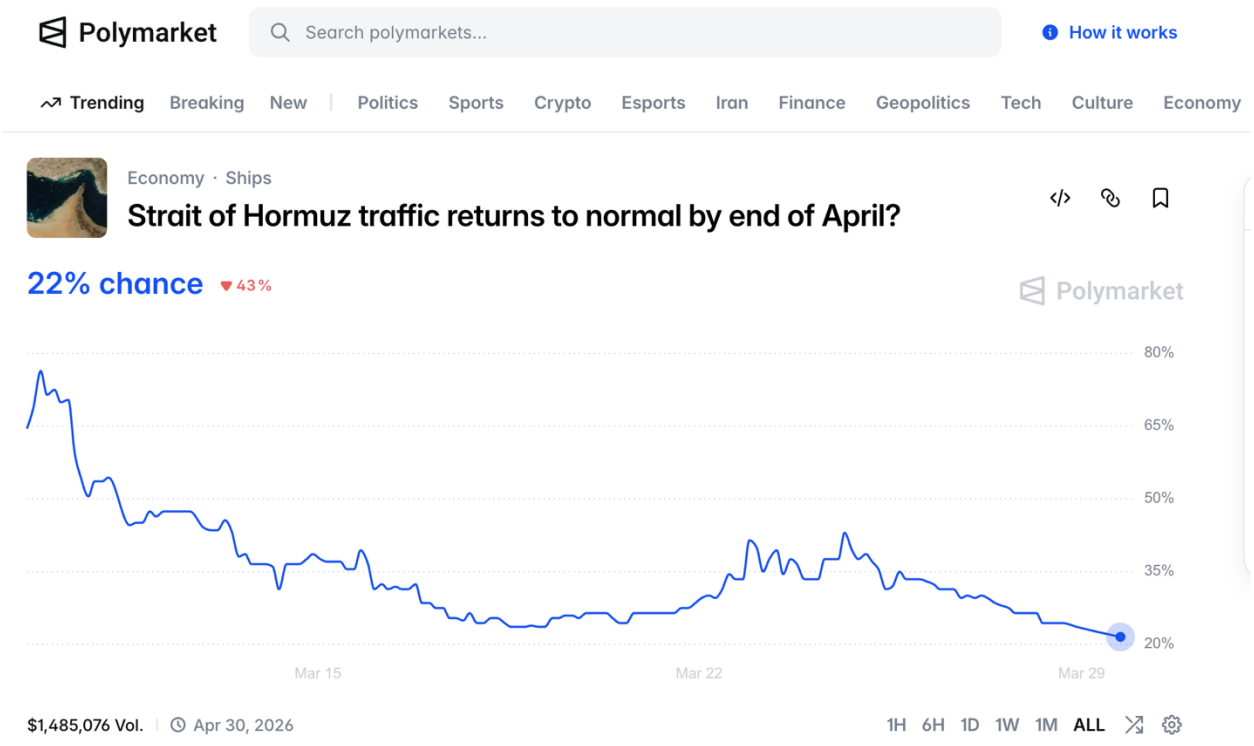

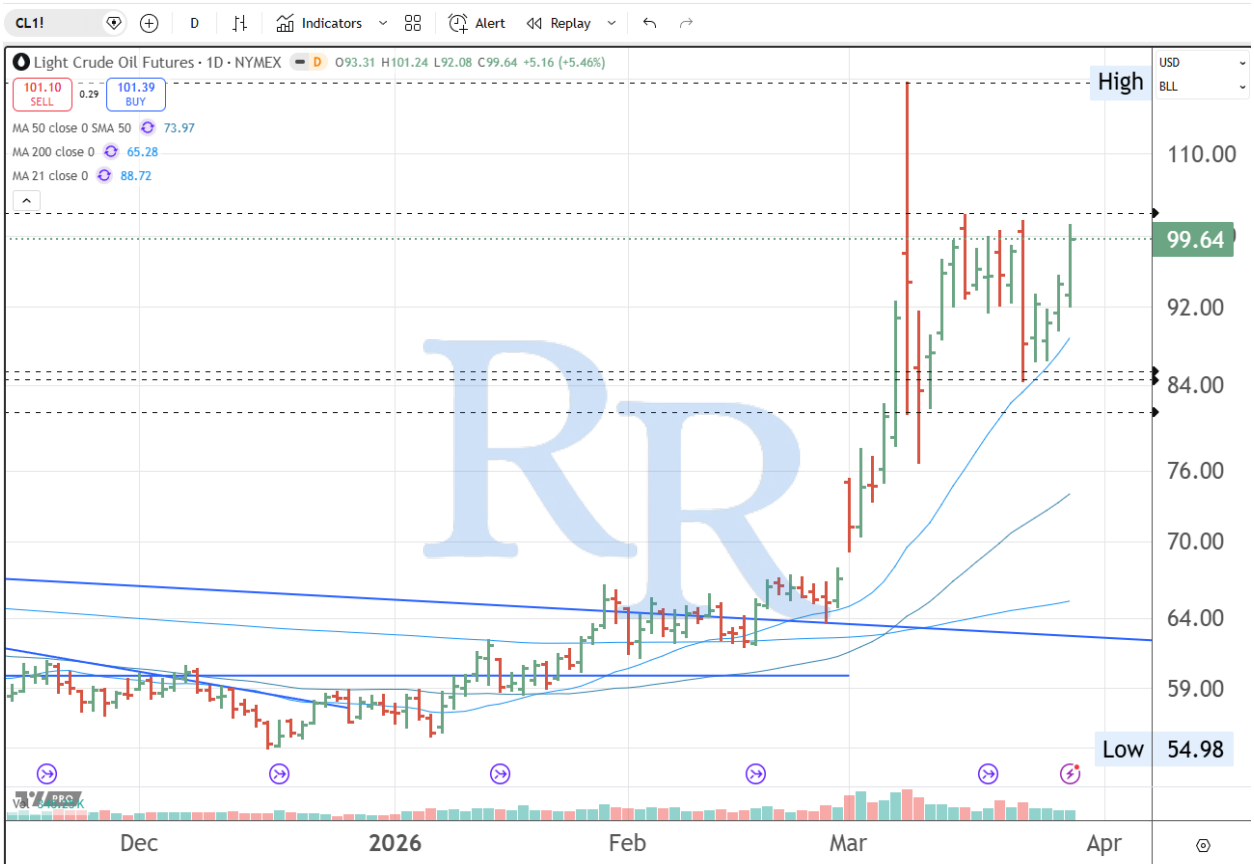

NASDQ Market Indicators: The big problem I see is that the OB/OS Oscillator is only -468; it could easily break below -1000, which is a waterfall break lower. Bulls have cooled off, but it could easily cross below bears. Bottom line is the NASDAQ is not oversold on a long-term basis. Caution, there will be counter-trend rallies.

VIX: I sound like a broken record, but at $31.00, I can only expect lower equity prices until the VIX climaxes or bursts and cave in below $18.00, but the VIX could reach $50.00 easily with trial balloons of boots on the ground in Iran.

Crude strongly resembles a very bullish flag pattern. With the explosive fundamentals of the crude market, a breakout over $103.00 could signal much higher prices. A move over $120.00, possibly much higher, is in the cards.

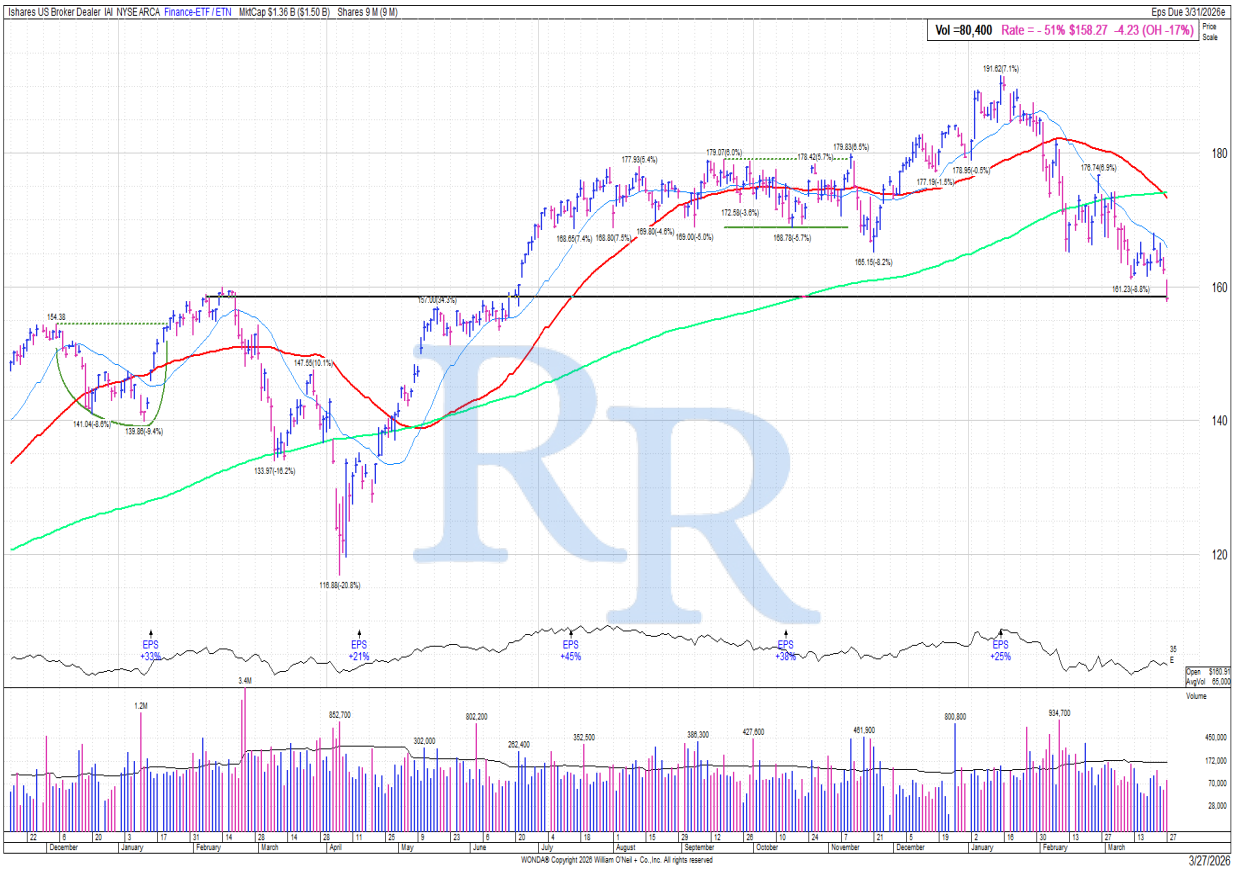

10-year treasury yields have been rising out of growing concern over looming inflation. Fed Funds futures are starting to price in a rate hike rather than cuts just weeks ago. Don't fight the Fed.

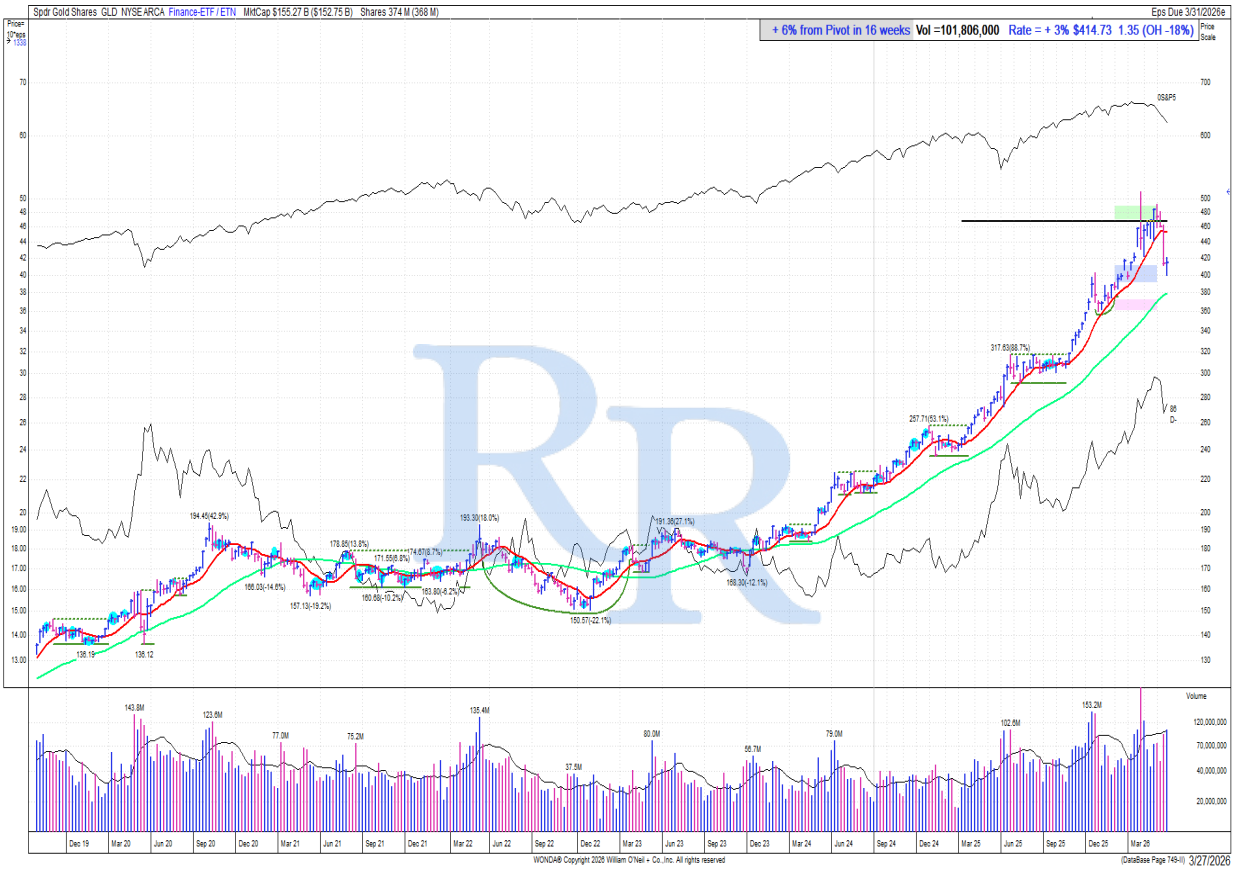

2-Year note yield is now above Fed Funds. The trend in rates is clearly up. Last Halloween, stocks were "Not Scary," but now with rates rising, they are.

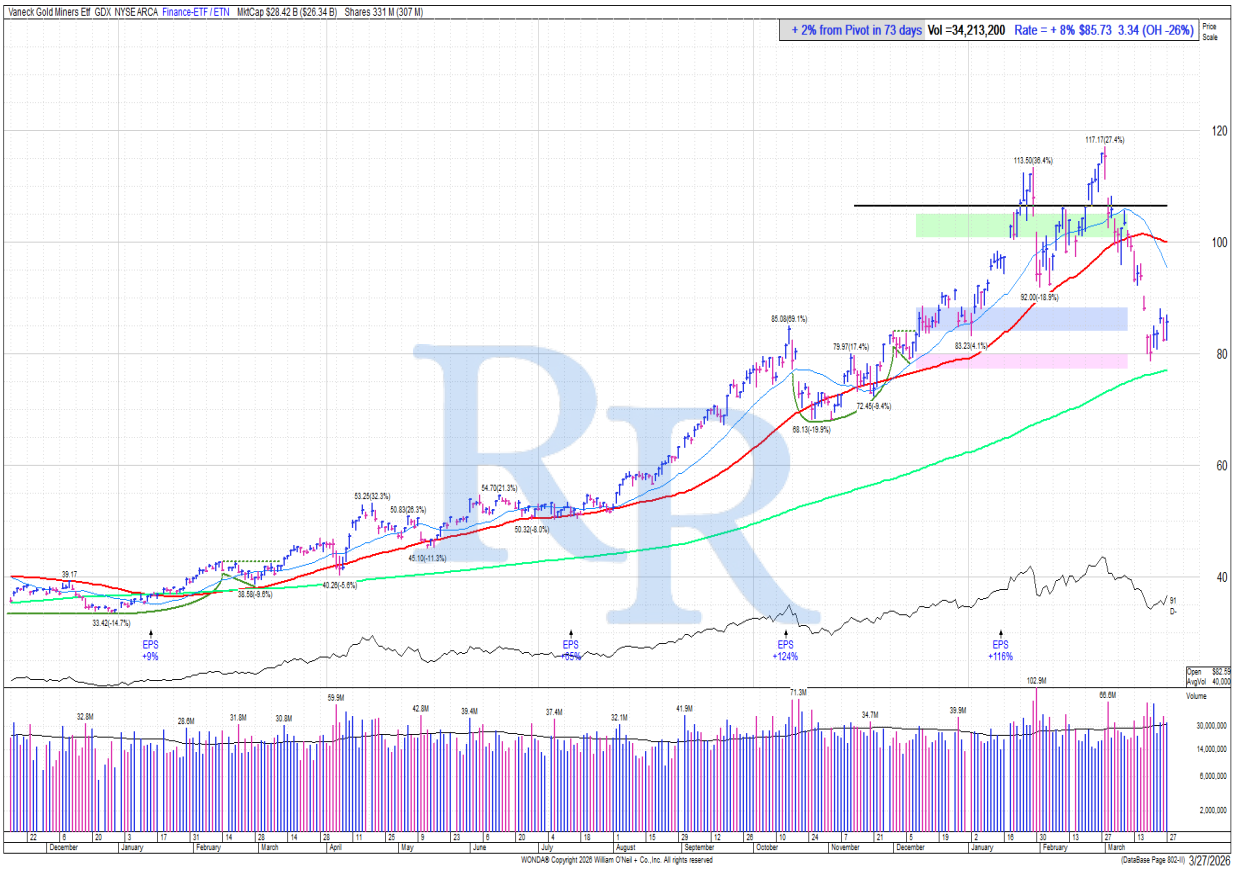

HYG: Credit spreads are starting to sniff out problems.

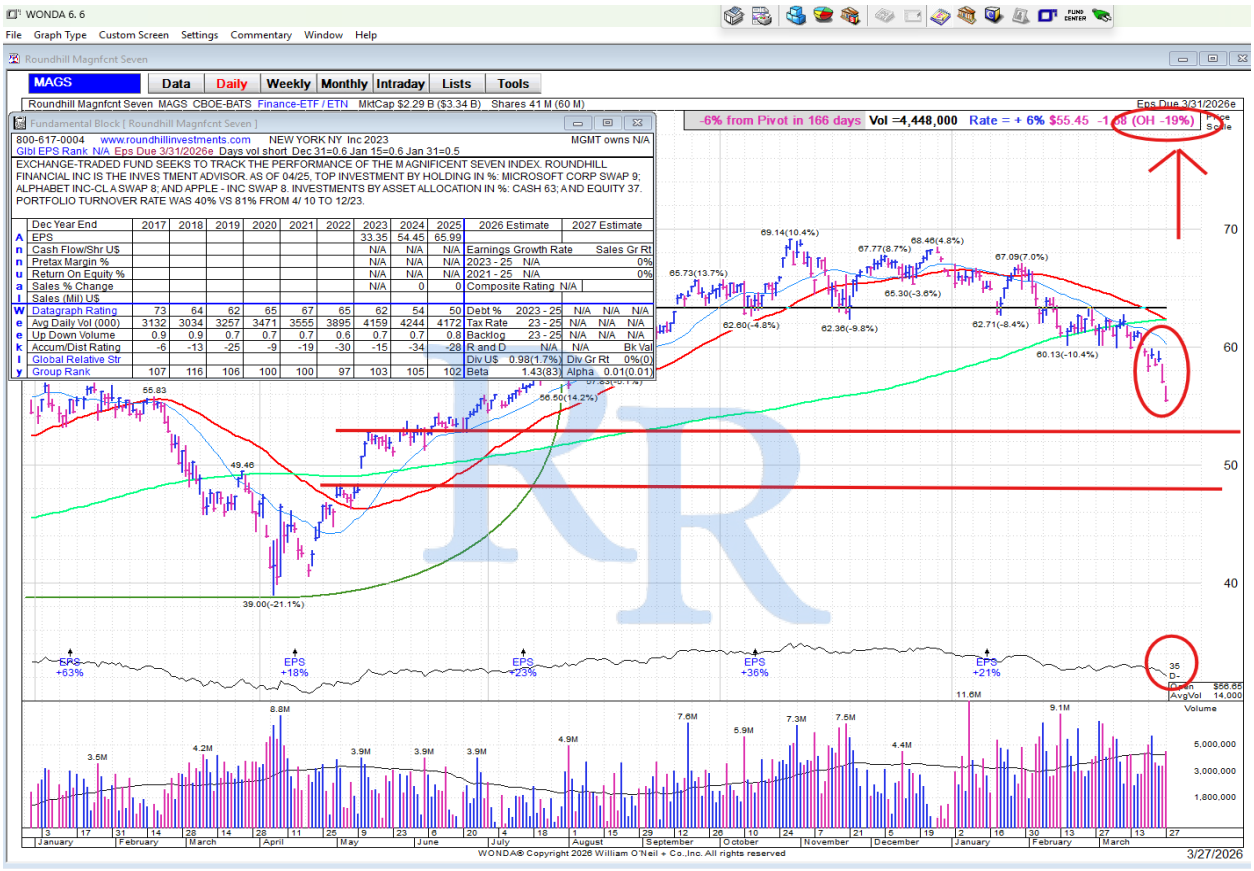

IAI: -17% off highs and accelerating lower.

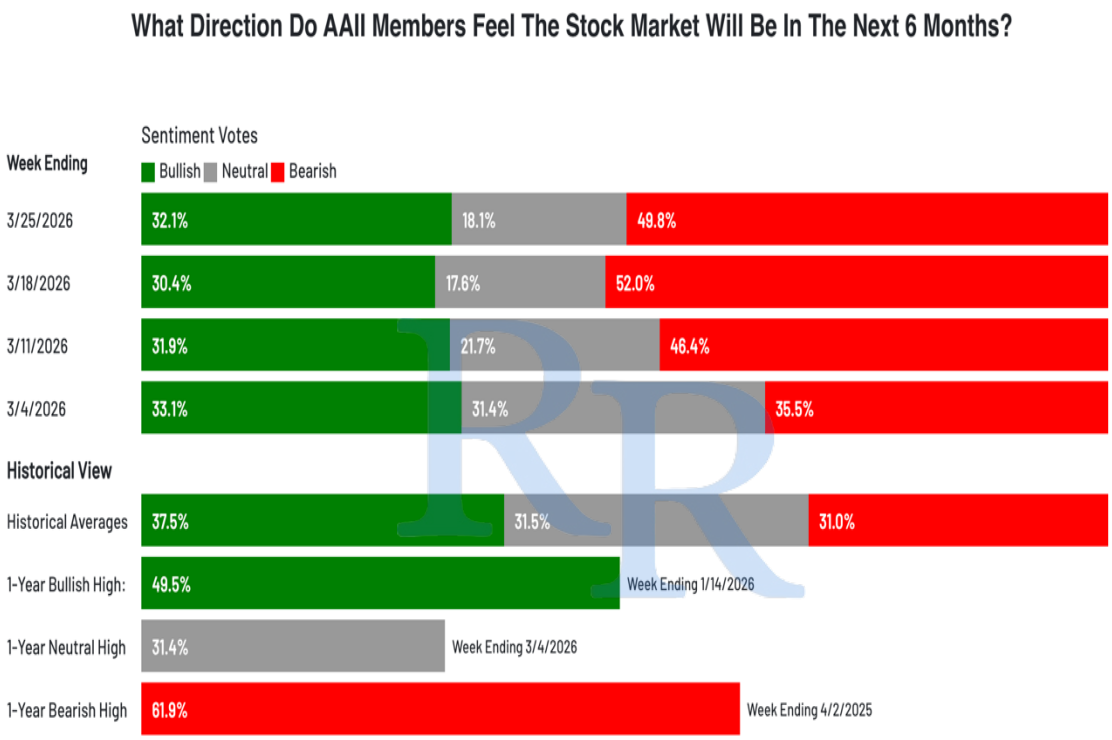

GLD caught a little support last week. It could be a good sector in the second half of the year.

GDX: This material breakdown is going to take time to mend, if it does at all.

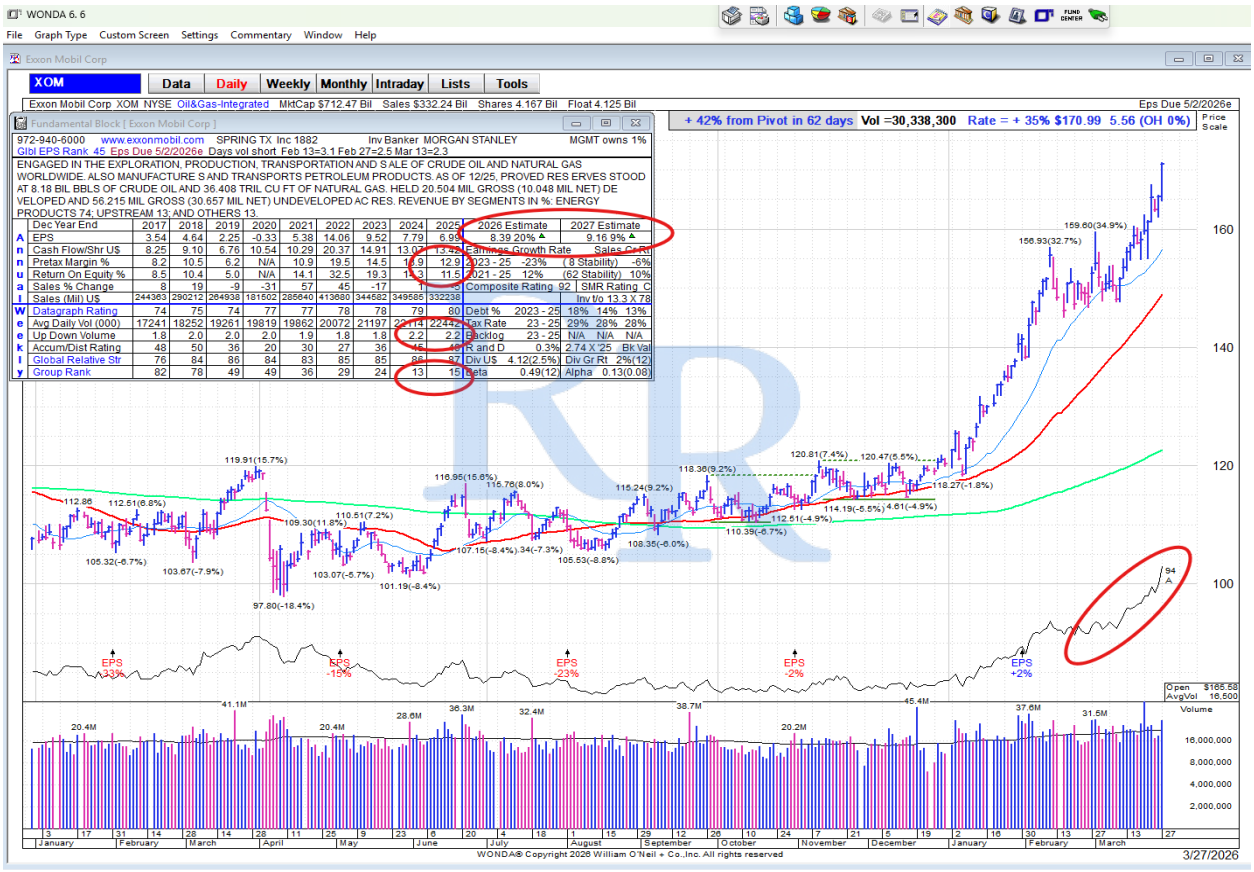

MAGS has been leading the broad market lower and started to accelerate last week. The first line of support was the breakout last May and June. It will be a significant tell for the general market if it can or can't hold. If not, $48.00 or lower is in play. It's going to be interesting. The rubber band is getting stretched, and I smell OPPORTUNITY!!!!!!!!!!!!!!!!!!!!!!!

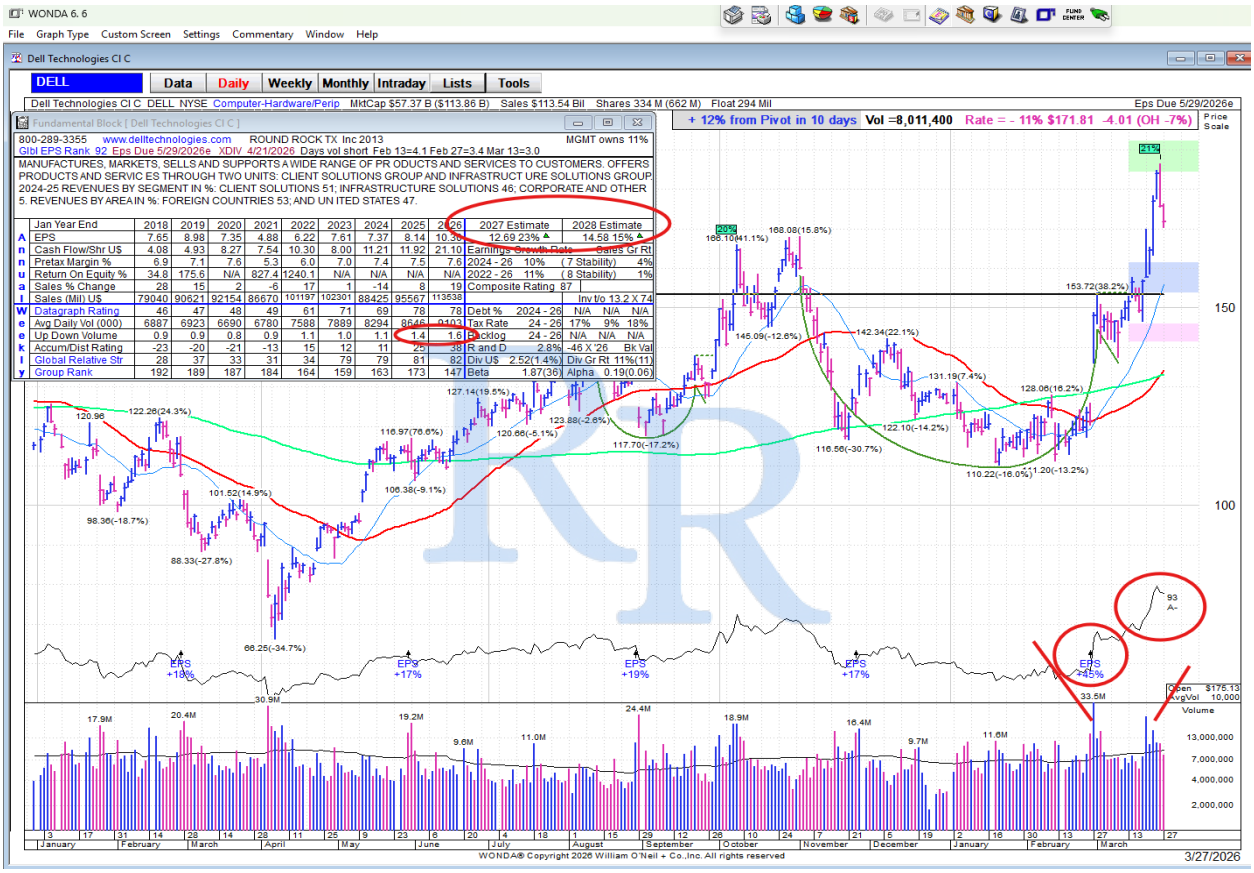

Bears overtook bulls, but be aware, at last year's lows, bears rose to 62%.

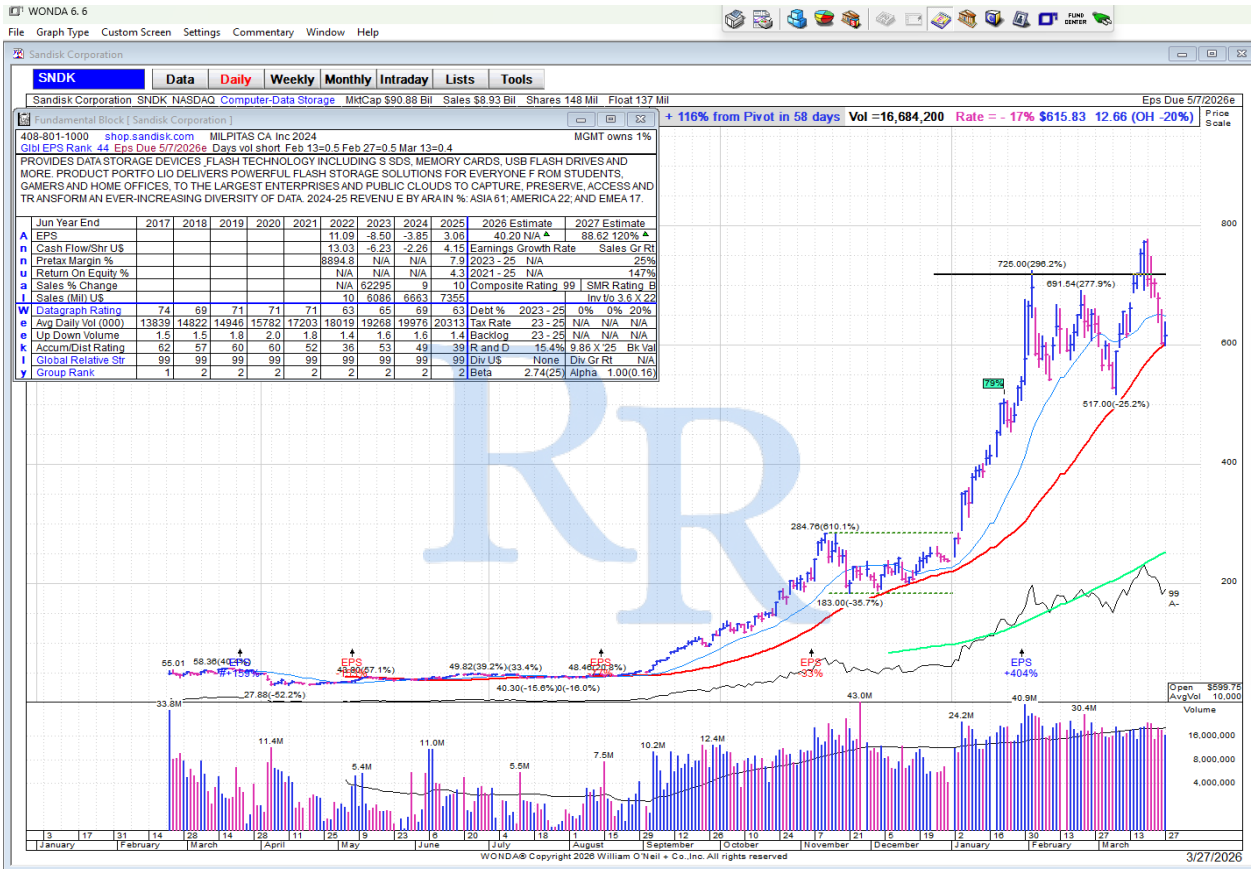

▼ Potential TMLs – Stocks of Interest

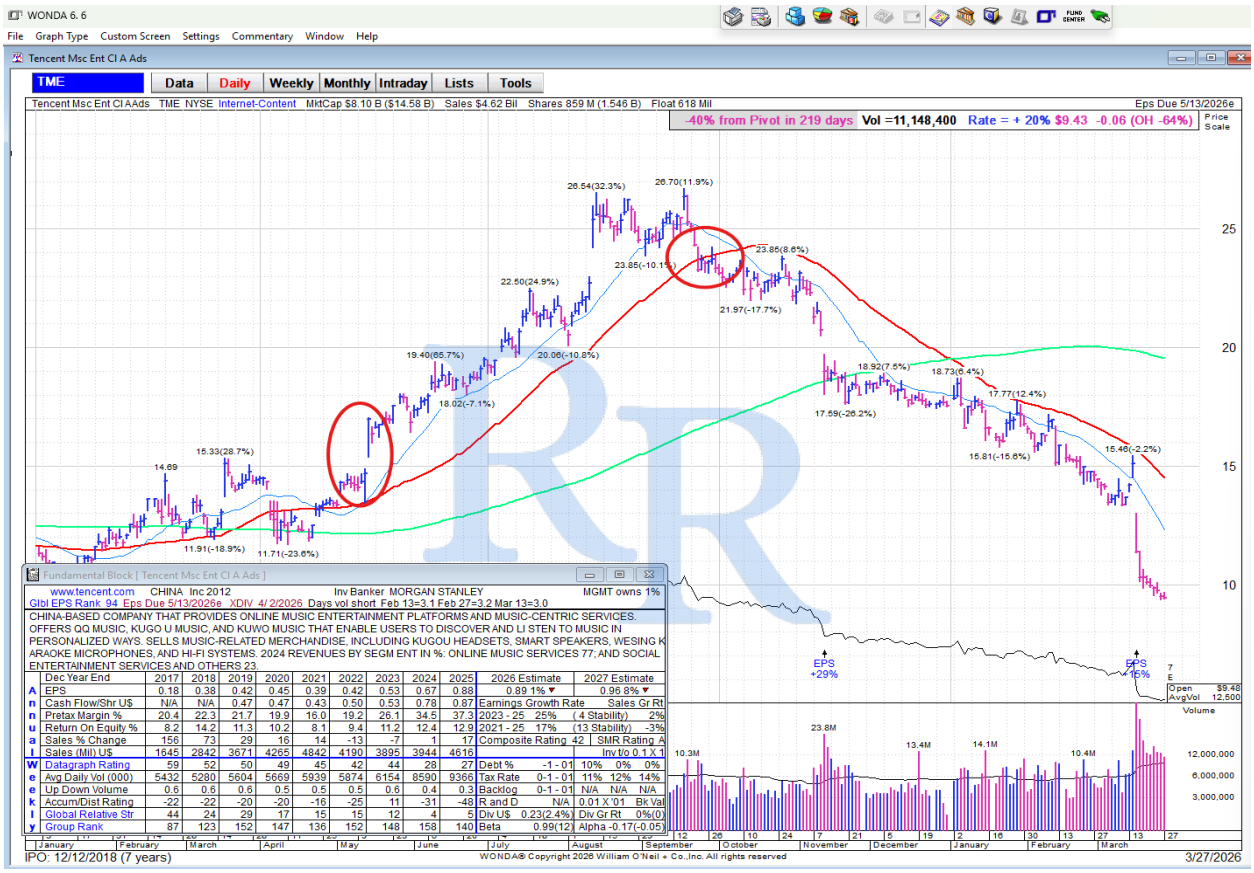

XOM is by a wide measure the high-quality, institutional darling in the O&G sector. 2.2U/D in a Mega-Cap is rare, rare, rare. XOM is the NVDA of O&G, but it's extended for now.

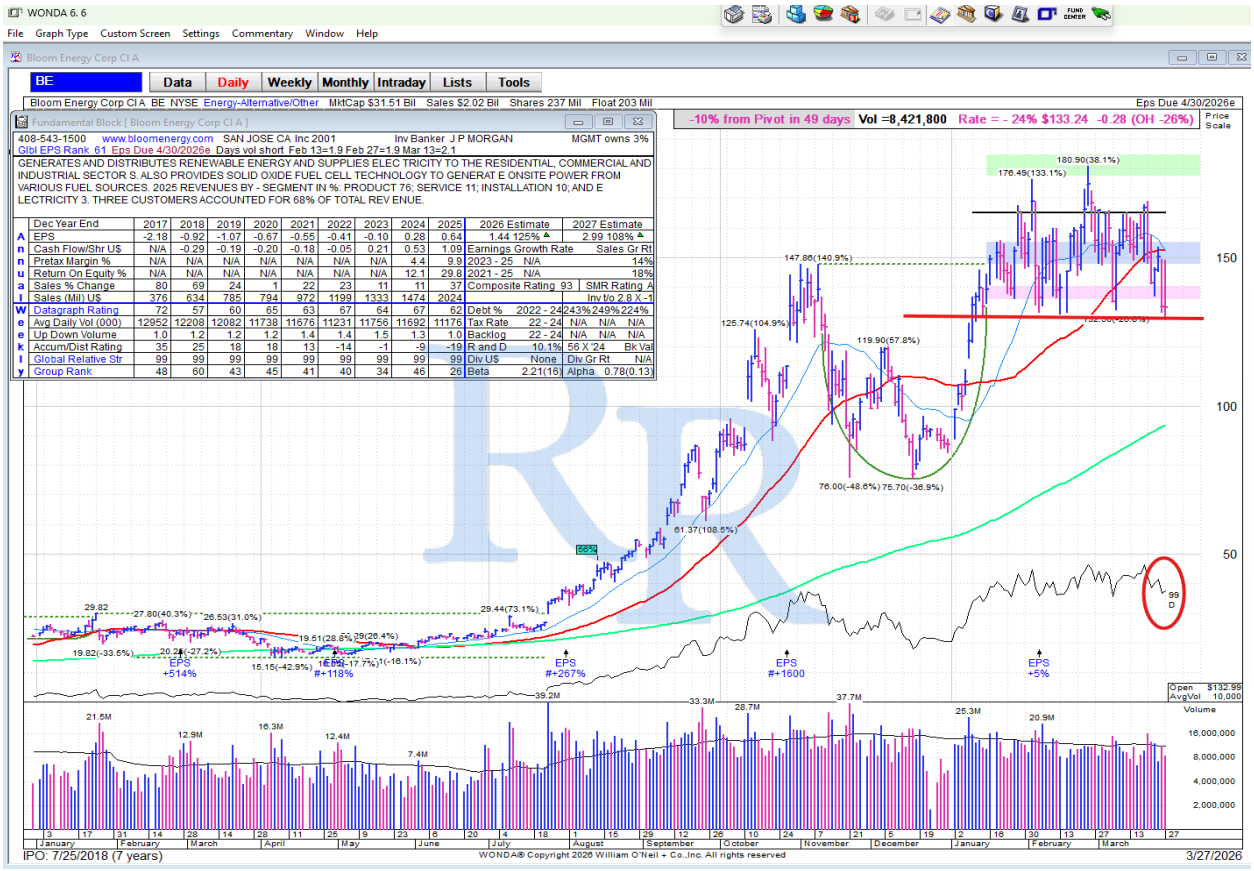

DELL had a very atypical, tricky breakout as it lacked volume and immediately undercut the pivot. I also balked at the poor ROE and margins; note the 87comp rating. But I can't ignore the strength, so I will monitor it for a possible pivot when general conditions improve.

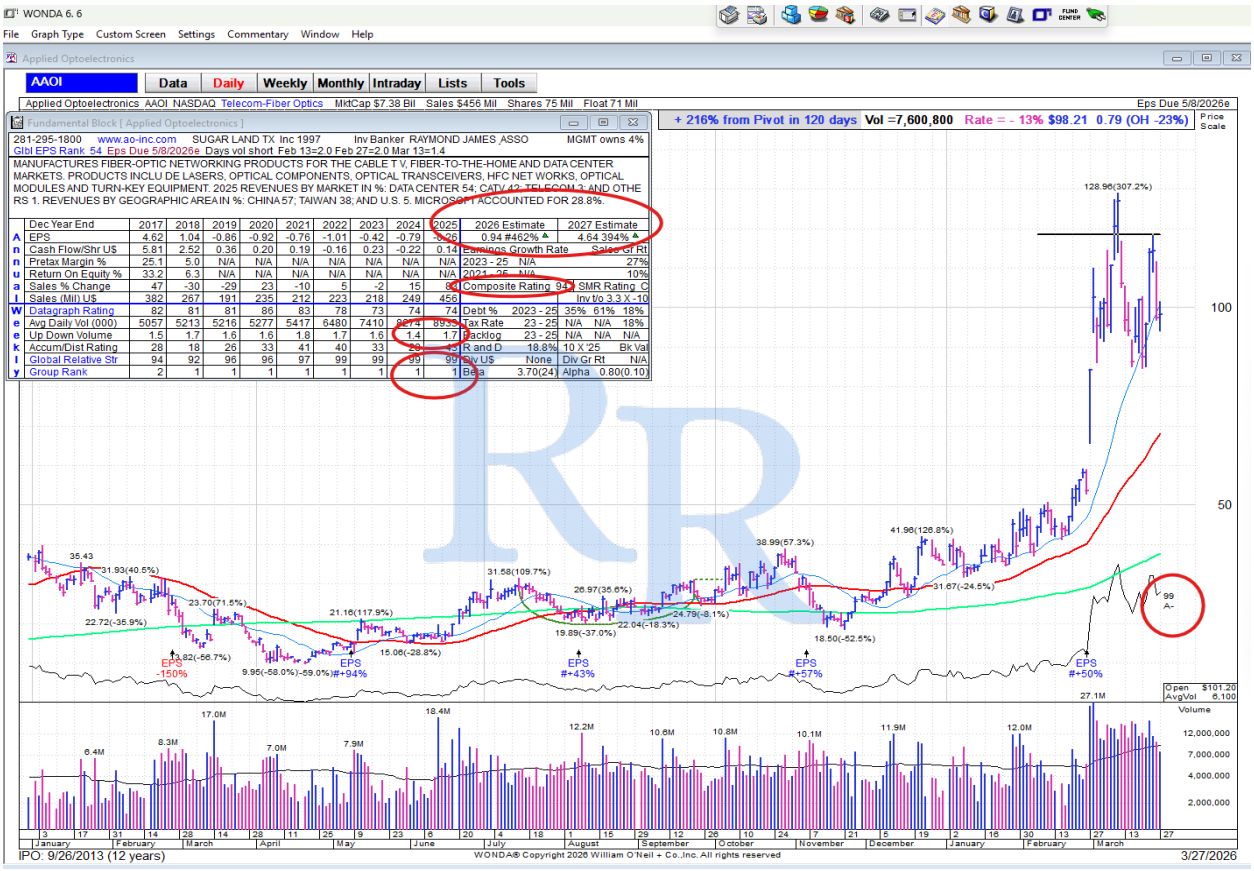

SNDK: The breakout from the flag has failed. With the general market so ugly, odds are a lot lower that it will catch support at the 50DSMA. Let's see if it can re-base.

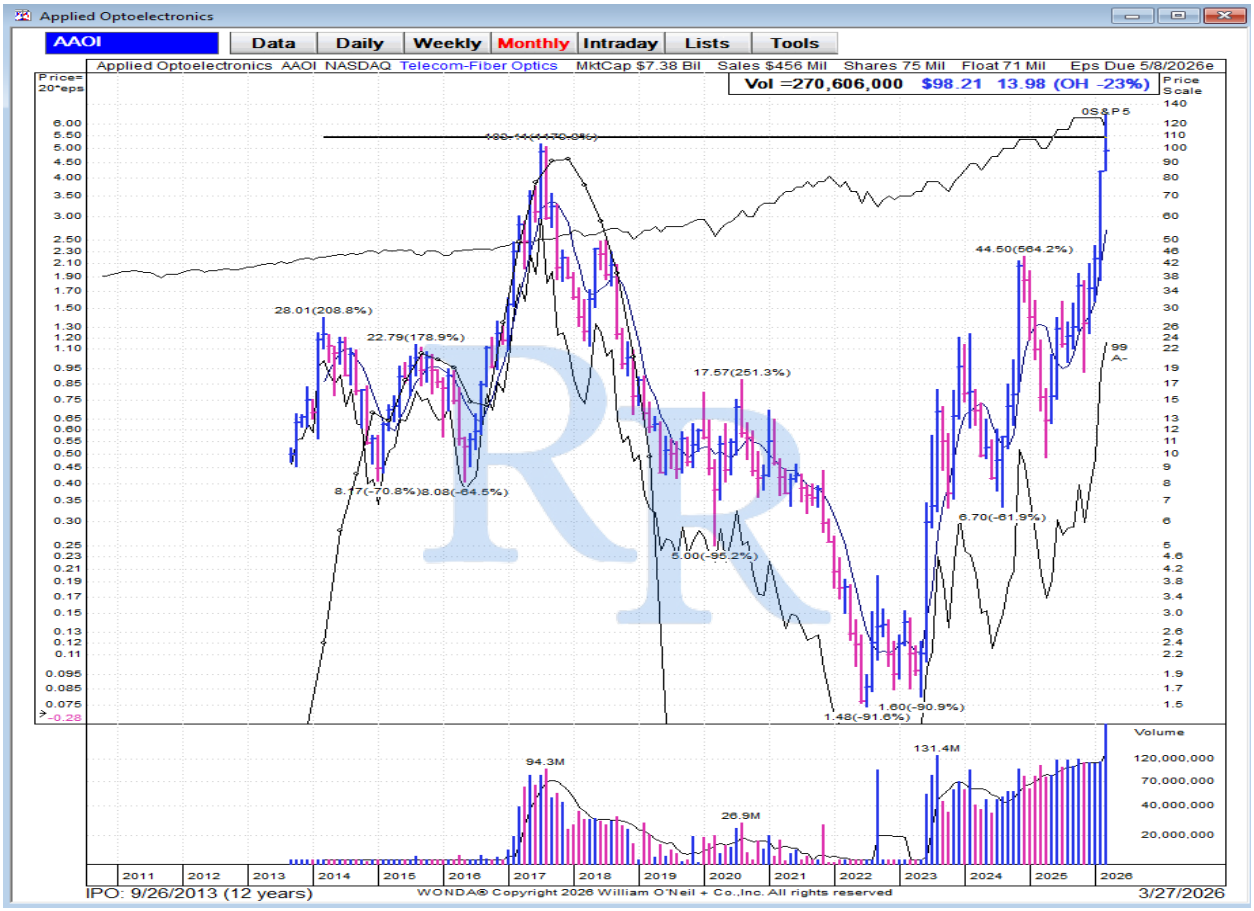

TME is a perfect example of why I call the 50DSMA: "The Guardrail." Breaking the 50DSMA last September set off an implosion below $10.00. Note the strong resistance the 50DSMA provided all the way down. RS is now a pitiful 7 and A/D = E = UGLY!

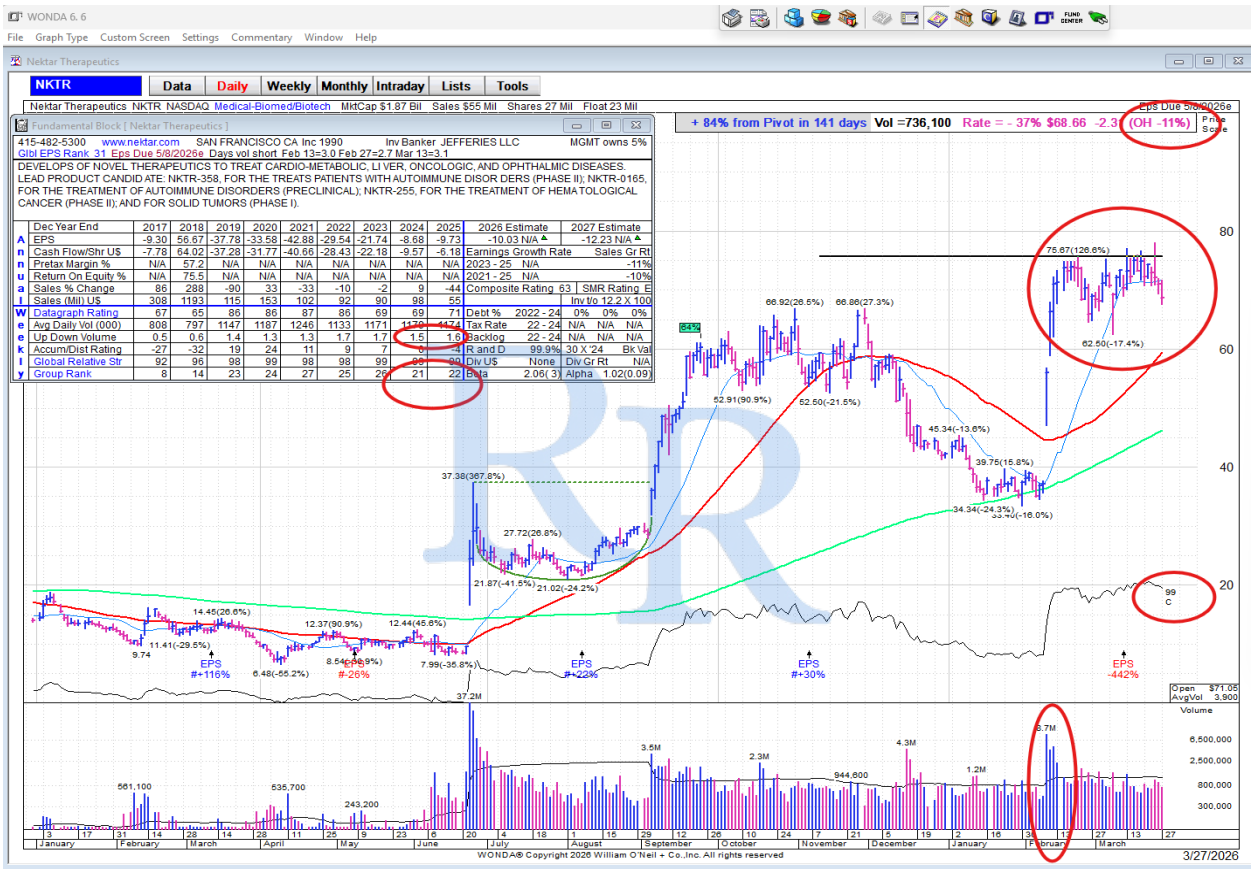

BE continues to trade wide and loose. Just like LLY did before it broke down. I have been incredibly patient and largely hedged with this name, but I am very close to dumping it. I LOVE the fundamentals, but the technical deterioration is proving too much, note A/D has declined to D. CAUTION.

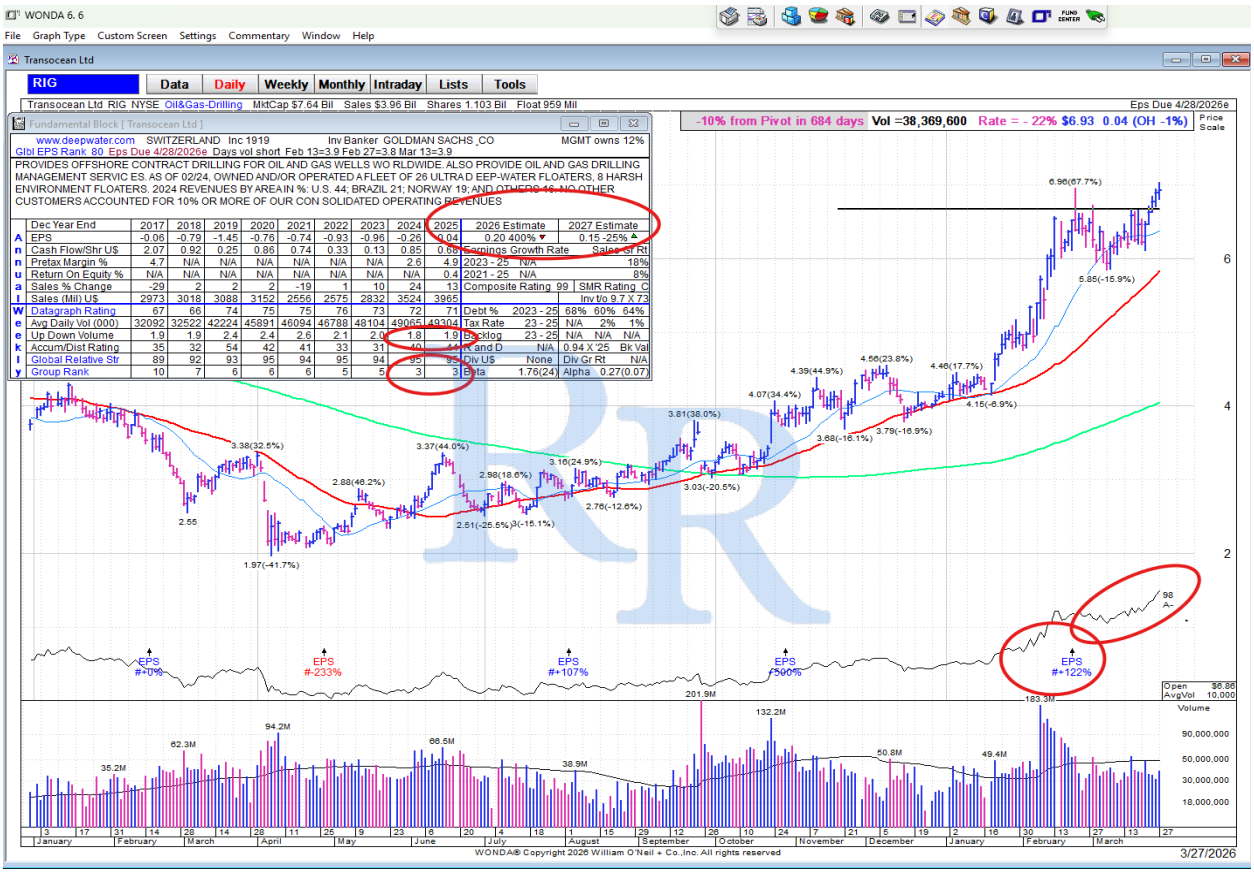

AAOI, because it has held the 21DSMA through this brutal tape, it must be monitored for new leader potential. The chart is loose but remains under accumulation.

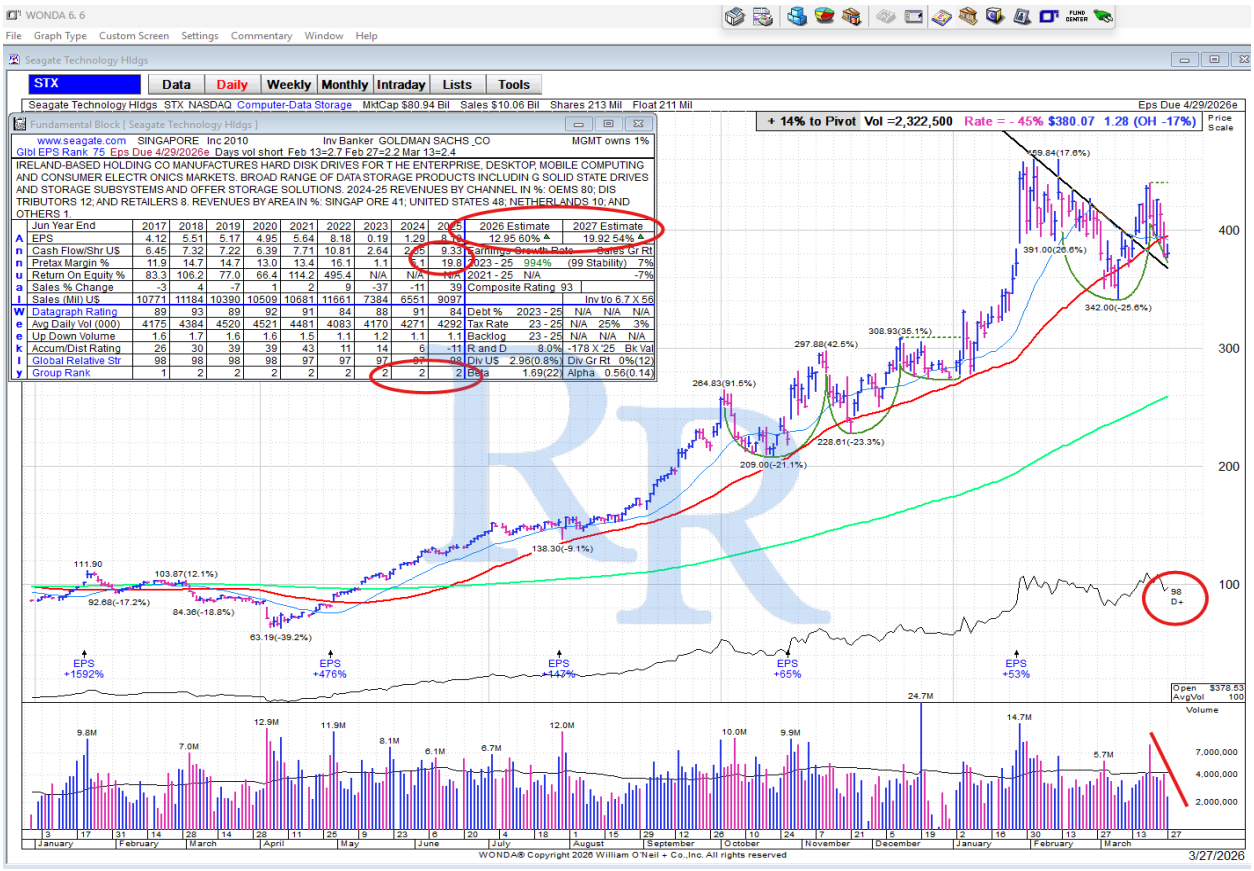

AAOI monthly: Note the Skyscrapers of Blue Volume Accumulation=SOBVA. It's also threatening to emerge from a large, deep 9-year base.

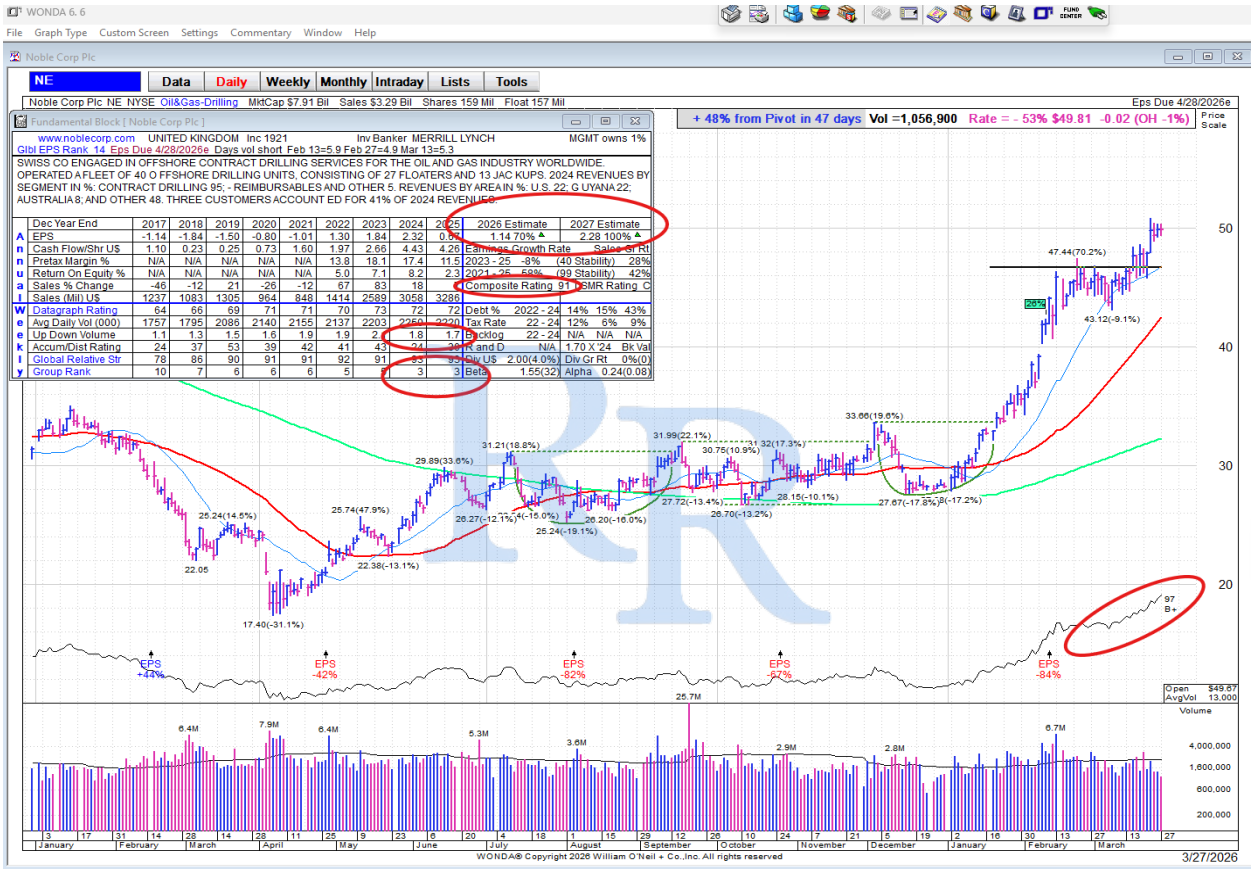

NKTR: This no-earnings, 1.6 billion market cap flea of fleas has been under mild volume distribution but continues to hold up exceptionally well, so far. Pivot into new highs.

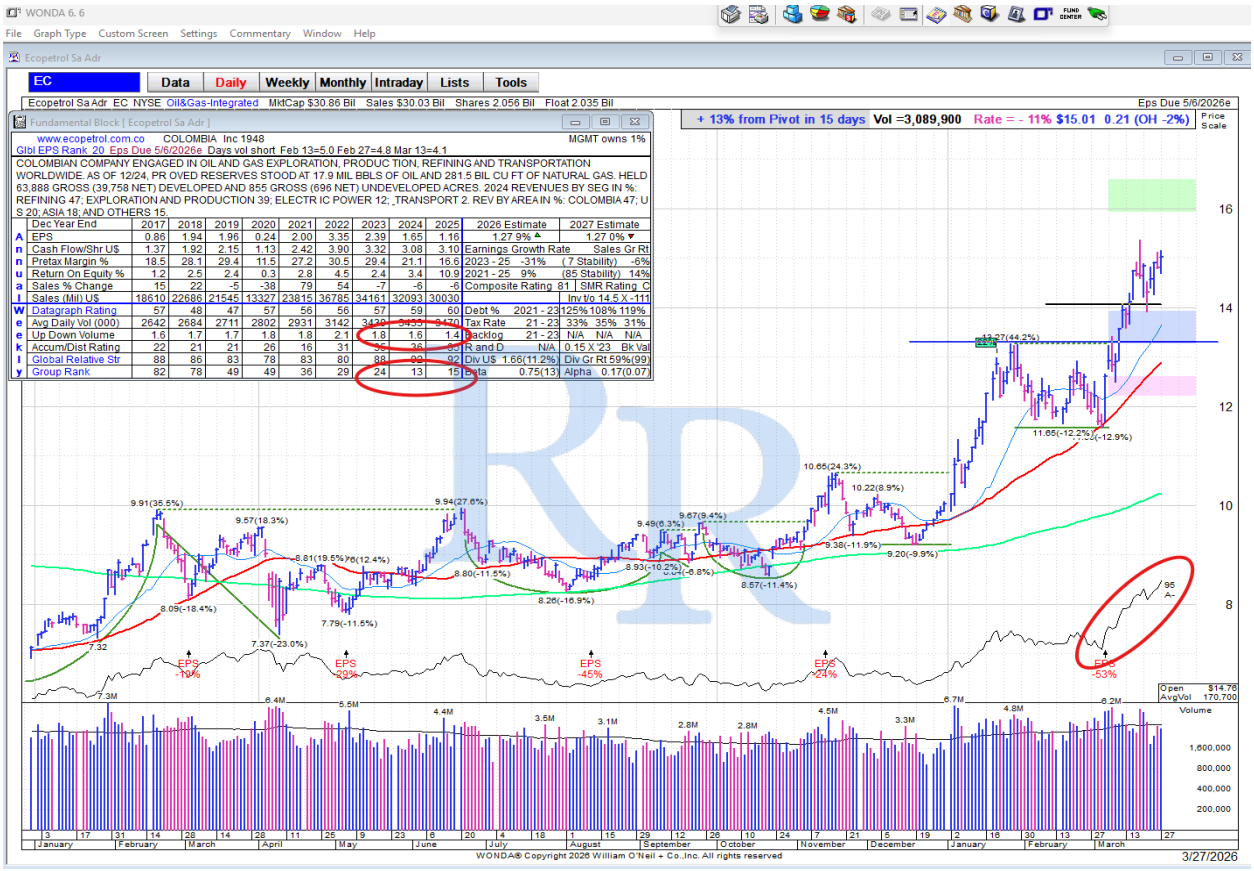

RIG has been limping out over its $6.00 pivot. I see crude higher for longer, even if there is an abrupt resolution to the Iran situation. It's really not a war yet; it's been more like target practice so far, but the odds of boots on the ground are 67% by April 30th on Polymarket.

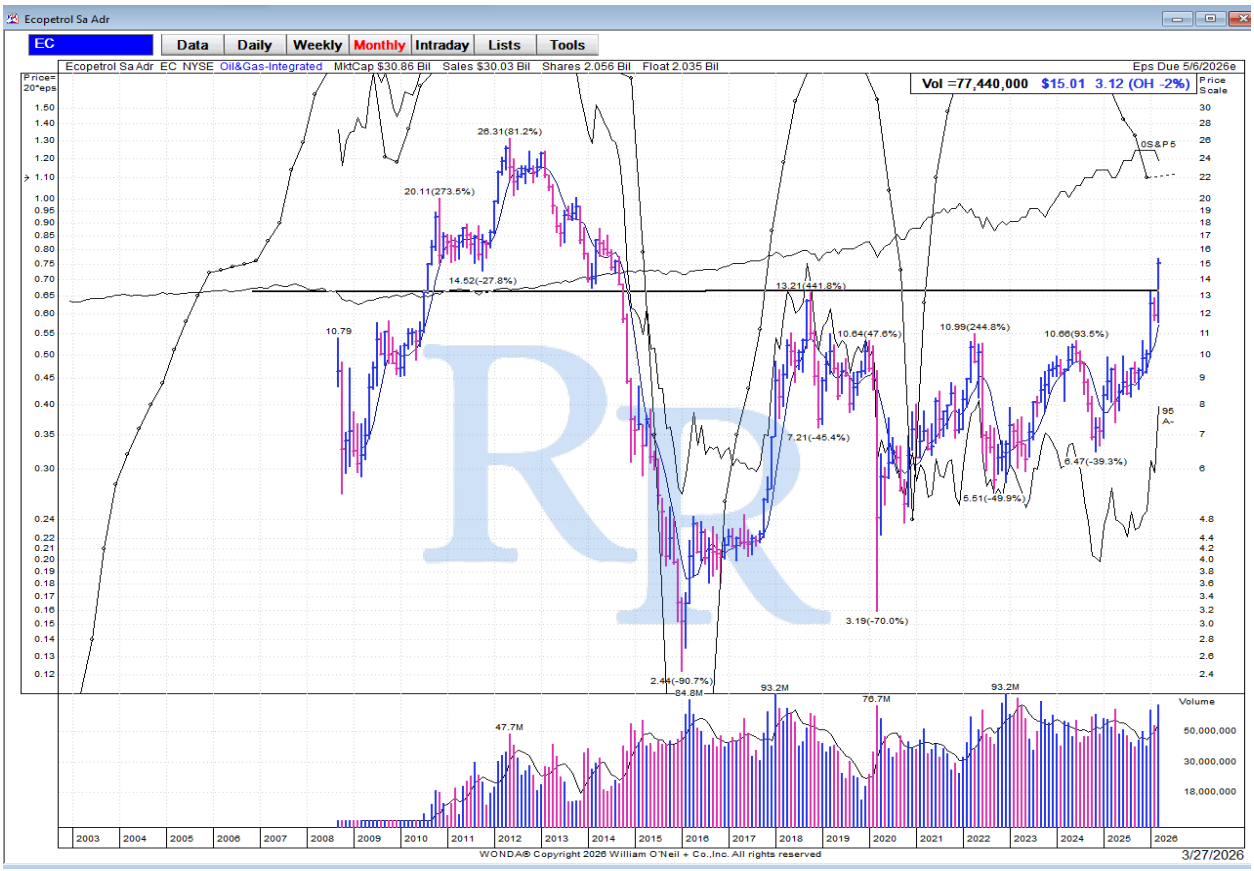

STX: Note the volume has been low as the general market sold off, pivot over $440.00.

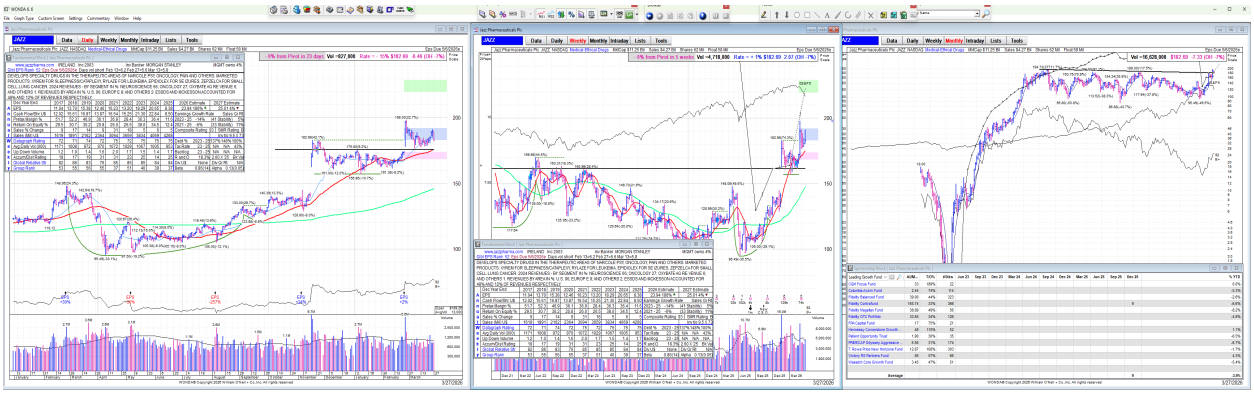

NE: Similar to RIG, it's limping out over its pivot on low volume. Note the raging RS97 line's trajectory. The last four days have been tight as volume dried up.

EC: I fell in love with the base below the $12.40ish pivot against my requirement for stellar corroborating financial metrics. I guess it had the Malcom Gladwell "Blink" look to me. I also like the Latin American twist. Right or wrong, I went long, and it's working; note the leading 95RS lines trajectory. I will continue to sit with cushion and let it age, hopefully like fine wine. We will see.

EC Monthly: I Love this base and SOBVA. I think the move up has more to do with group strength vs the Blink effect.

JAZZ continues its healthy digestion. I love the 10-year base, and FIDO just started a probing position. It's not the most liquid, but I still like the name.

Stocks for further research:

LITE – base was too short and loose, but holding up well, so far.

TSEM – a newer name that has been defying the indexes.

COHR pivot $281.25.

PBF, PBR, and HAL are off and running. I see crude higher for longer. There are so many O&G names outperforming, I can't name them all. O&G is a must-own sector for now.

FIX – looks good, but illiquid.

MU – now looks like a broken stock.

NBIS was looking great, but was dragged down by the general market last week.

FIT – O&G is on fire, but volume has been lacking.

PTGX

ETON is nearly a penny stock, but it has great metrics and a chart. This is an uber speculative name, CAUTION.

KNSA******** Looks Great.**

WWD

▼ One of Bill's Golden Rules

Failed Breakouts are a *major negative* signal that the indexes may be turning down. For example, MDY and IWN in October- December 2021.

Forcing your way into a market that is not robust, often in anticipation, is *very* different and high-risk vs being forced into a market because of its power and number of proper bases breaking out on robust volume.

A lack of proper bases is a signal that the FTD has a higher risk of failure.

Walter Deemer - *The stock market is a leading economic indicator. The stock market will tell you what the economy is going to do; the economy will not tell you what the stock market is going to do.*

▼ Random Thoughts

I think it's important to disclose that I am almost a perma-bull. I am usually the last bull standing, and by the time I turn negative, historically, bottoms have been close at hand. I have also been known to go short around bottoms, sometimes I have shorted the market at the dead low or within days of it. Maybe this time my bearish stance will be timely. Regardless, now is no time to be cowboy long or even intermediate-term long.

Do not lose sight of the bull case, which is American Exceptionally BULLISH, and this digestion/correction is winding the coil tight and will at some point release its explosive energy to give us an opportunity to have a big year. There are still 9 months to put up some big life-changing performance. ALWAYS look for the BULL case and be ready to pivot bullish on a high-quality FTD. Between now and the eventual FTD, it's time to read or re-read the classic market books and ask me questions on Wednesday nights.

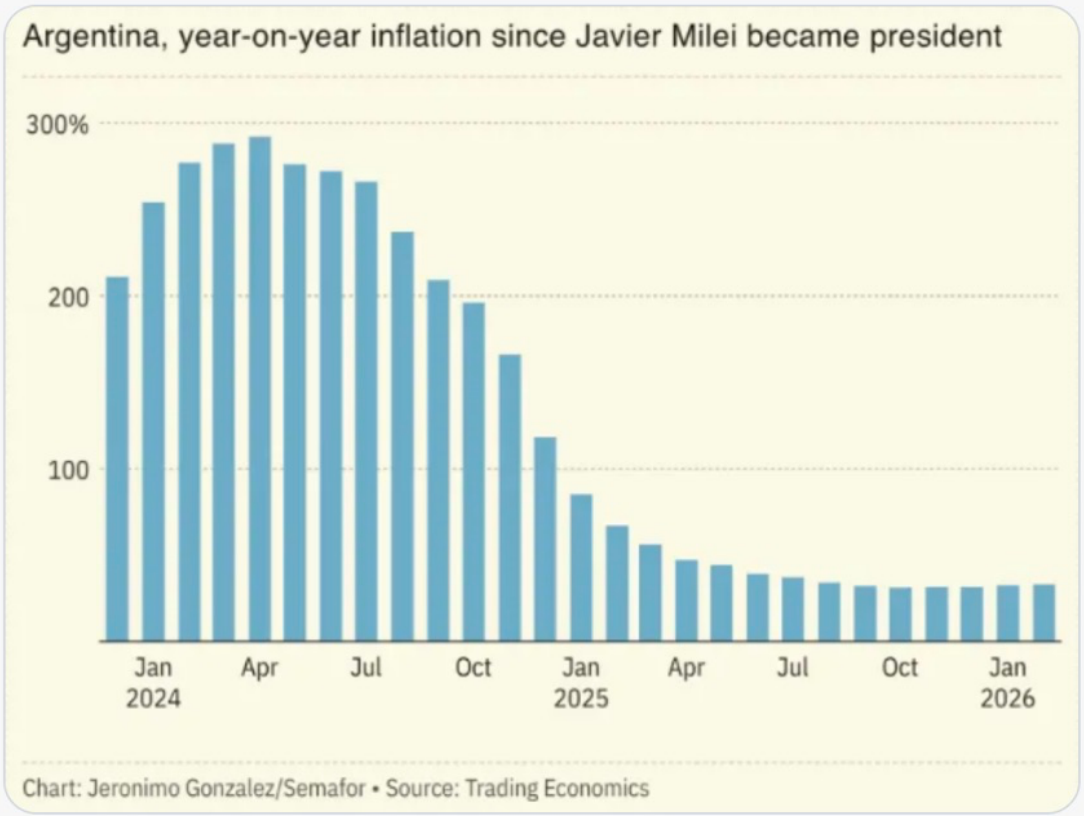

O&G stocks are saying crude will be higher for longer.

My last thought after going through the charts is that a waterfall decline is possible, even possibly on Monday's open or at any time in the near future. The Iran headlines were mostly negative over the weekend. Because of this, I took a very speculative bear put spread on SMH last Friday. That is very out of character for me, but I feel it's worth the risk. Of course, I thought the same way over the last two weekends, and Monday's opens where not disasters. I think the markets have been sleeping on the possible duration of the Strait being closed, troops on the ground, rising US casualties, and the odds of Trump/the US forcing regime change and permanently ending Iran's nuclear ambitions. I remember Trump commenting about George Bush's war against Iraq, he said Bush should declare victory and move on. I would love for Trump to end Iran's reign of terror on its citizens and the Middle East, but it's a tall order. If, If, if he gets it done, it would be one of the US's top 5 services to the world. Feel free to throw rotten tomatoes at me!!!!!!!!!!!!!!!!!

With all the historical evidence that bear conditions, like we just experienced, prices will be higher in 12+ months. It's shocking that AAII members remain so bearish over the next 6 months. It's my assessment that they are running on emotions, recency bias, and historically, they are nearly always wrong at major turning points. Right now is the time to be funding your war chest for the growing opportunity to move up to a higher financial station. I feel the opportunity will be equivalent to 2024.

IDDF: Institutional Due Diligence Phase

Flea/Micro-cap Stock: It has a market cap of less than $2 Billion, is Illiquid, and has no institutional sponsorship.

O.G: short for “original gangster” or “original gangsta,” is a slang term for someone who's incredibly exceptional, authentic, or “old-school.” OG was originally used in gang culture, but it is now used as a general term to praise someone who is an expert at something.

Disclaimer:

All communication from the Roppel Report is general in nature and for educational and general informational purposes only. Under no circumstances should it be considered personalized investment advice. All our work is general in nature and not specific to any one person. All the information on this site and/or that originates from us, or any of our partners or affiliates, is for educational and informational purposes only and is NOT a recommendation to buy or sell anything. To avoid any conflicts of interest, we do not have a working relationship with any of the companies mentioned in our work. Furthermore, we may have a long, short, or no position in any or all of the names that appear in our work, and they may change at any time without notice. Investing and trading in capital markets or using margin carries a high level of risk and may not be suitable for all investors. Leverage can work against you as well as for you. Before you invest or trade in capital markets, you should carefully consider your investment objectives, level of experience, and risk tolerance, among other factors. The possibility exists that you could sustain a loss of some, all, or more of your initial investment, and therefore, you should not invest money that you cannot afford to lose. You should be aware of all the risks associated with capital markets, investing/trading, and seek specific investment advice from an independent financial advisor and other professionals. Remember, all the information we provide is for educational and general informational purposes only and is subject to change without notice. Contact Us: info@RoppelReport.com
