THE ROPPEL REPORT

Please find important disclosures at the end of this report.

©2026 Roppel Report, LLC - All rights reserved.

▼ Market Temperature

My Buy Window is: Partially Open.

RISK MITIGATION: Always cut losses in 33% lots at -3%, -4%, and -5% — but in practice, the -5% level is almost never reached. The -3% cut is automatic: one-third is sold, no exceptions. At -4%, another third comes off. Beyond that, use judgment. If a breakout fails on weak volume — less than 40–50% above average — and closes at the low of the day, don't wait for the 3-4-5 scale; exit immediately. In hedge fund accounts, losses are cut in 15% lots beginning at -3%.

All buy ideas require a significant pickup in volume to validate the breakout or a minimum-volume pickup of 40%, ideally 500%+.

0 is the most negative term outlook, and 10 is the most bullish. It's reasonable to say that if the market temperature is 5, your total exposure could be 50% long.

***Additional disclosures at the end of the report.**

Short-term Trend 1 to 3 weeks (5/10)

***Please note that the short-term temperature can change at any moment, and I have the least confidence in this time frame.**

Intermediate-term Trend 4 weeks to 5 months (6/10)

Long-term Trend 6+ month Trend is up: Bullish (9/10)

I am seeing a lot of climactic action and a few full-blown climax runs in semis that are obvious and stale. I remain a long-term bull and believe we are in the greatest bull market of my life, but I think it will be a long boom made up of a dozen rolling waves/cycles. Parts of this wave have become excessive. I have been building hedges in the indexes and a few of my leaders. I was overly hedged last week, and it cost me dearly. I am not sure if I was early or wrong. The "Golden Goose" needs to cool his jets for a minute. AI is the biggest revolution in human history and is likely to produce the most extreme levels of extension. Caution #1: I could be early, but the moves down after climax tops can be extreme air pocket plunges as bids evaporate and liquidity dries up. At the least, if you can't endure a move down to the 50DSMA, hedge, trim, or sell.

Please review the commentary below, penned by William J. O'Neil, the #1 stock trader of all time, who taught me everything.

- After already making a move up 18 or more weeks out of a first or second stage chart base, the stock suddenly accelerates. In many cases it will rise 25-50% in just one, two or three weeks.
- Many times on the daily chart, you'll see the stock go up seven out of eight days, or eight out of ten days in a row. Often, one of the days will be the largest daily point gain of the entire move. On a weekly chart, the stock will often have the largest weekly price spread, from low to high, of the entire move.
- Often the demand will be so great for the stock that it will create an "exhaustion gap" where the stock's lows for the day are higher than the previous day's highs. It is important that this occurs after the stock has already made a significant move.
- Excessive stock splits can be a signal that a climax top may be near. Either with a high frequency of splits, two or more in the last year or so, or high split factors, such as 3-for-1 or 4-for-1 stock splits.
- On a weekly logarithmic chart you can draw an upper channel line over several months, connecting the highs of at least three points. When the stock breaks above this channel line, it is a sign the upward move is getting out of control.
- You might also see a wide weekly spread followed by a week that retraces the same wide spread, from its low to its high, with volume remaining high. It shows up as two parallel vertical lines we call "railroad tracks."

With all of the above signals, it is important to remember that they occur after the stock has already made a significant move.

There have yet to be any material stock splits, but there will always be a missing part to the stock market puzzle.

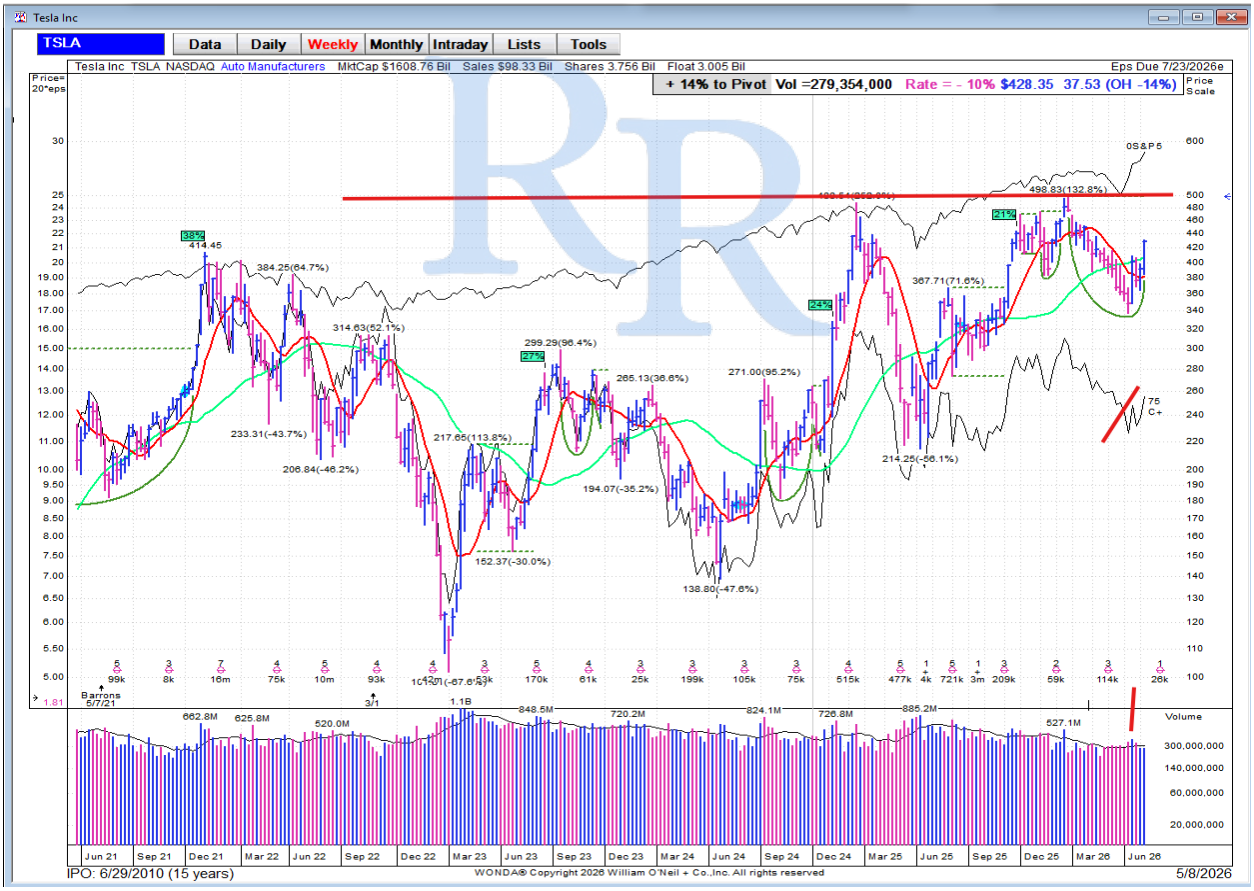
▼ Best Actionable Ideas

This list is only to be utilized when the Market is in an uptrend. Ideas are only actionable at or above pivot points on significant increases in volume.

Hedge, trim, or sell parabolic, climax moves. There could be new names that emerge as the current leader's digest. Rotation is the lifeblood of bull markets.



TSLA's weekly personality has turned fledgling bullish. TSLA has given many false starts, so I would keep positions small, until, if, if, if it ever breaks over the real, legitimate $500.00 pivot. The magnitude of the fundamental story, TAM, coupled with the Edison of our lifetime = Elon Musk, makes me willing to accept the added risk of building a small position right here.

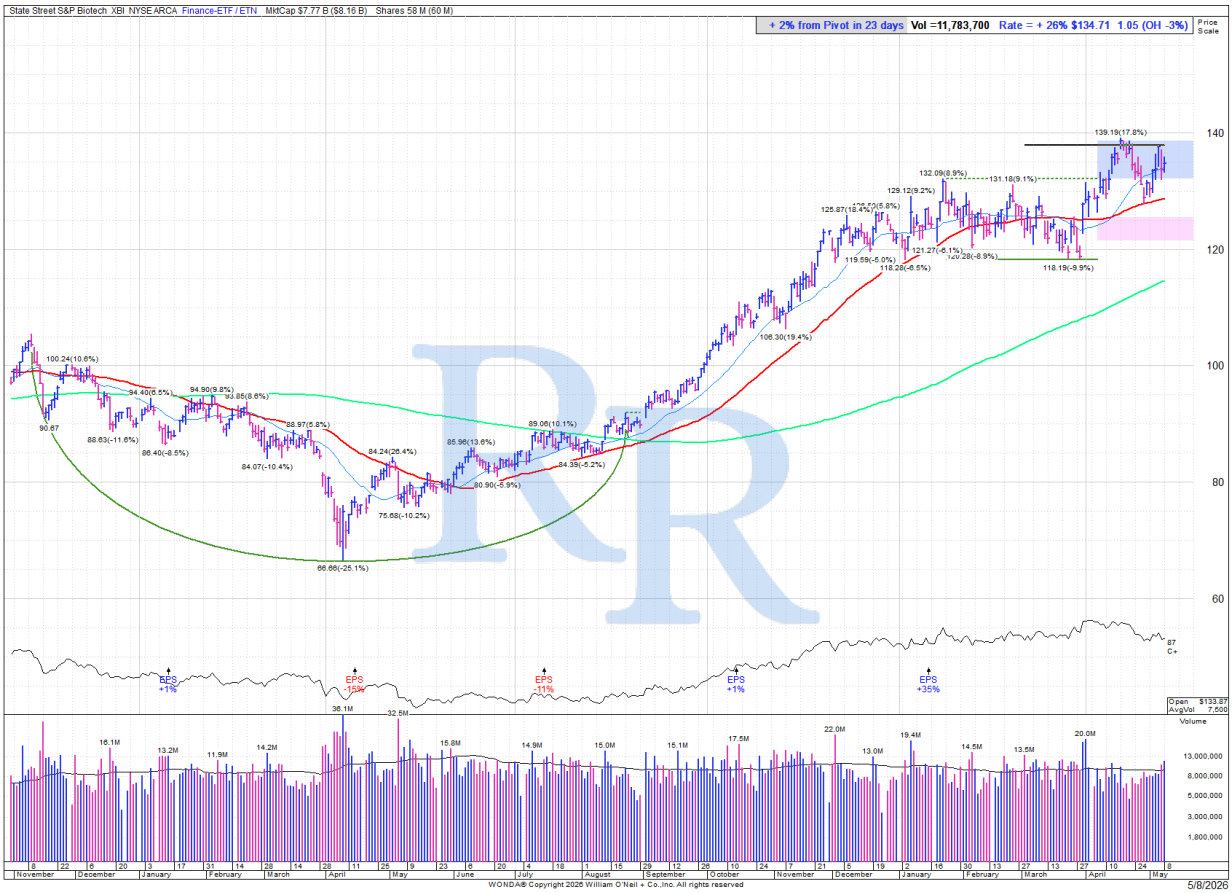
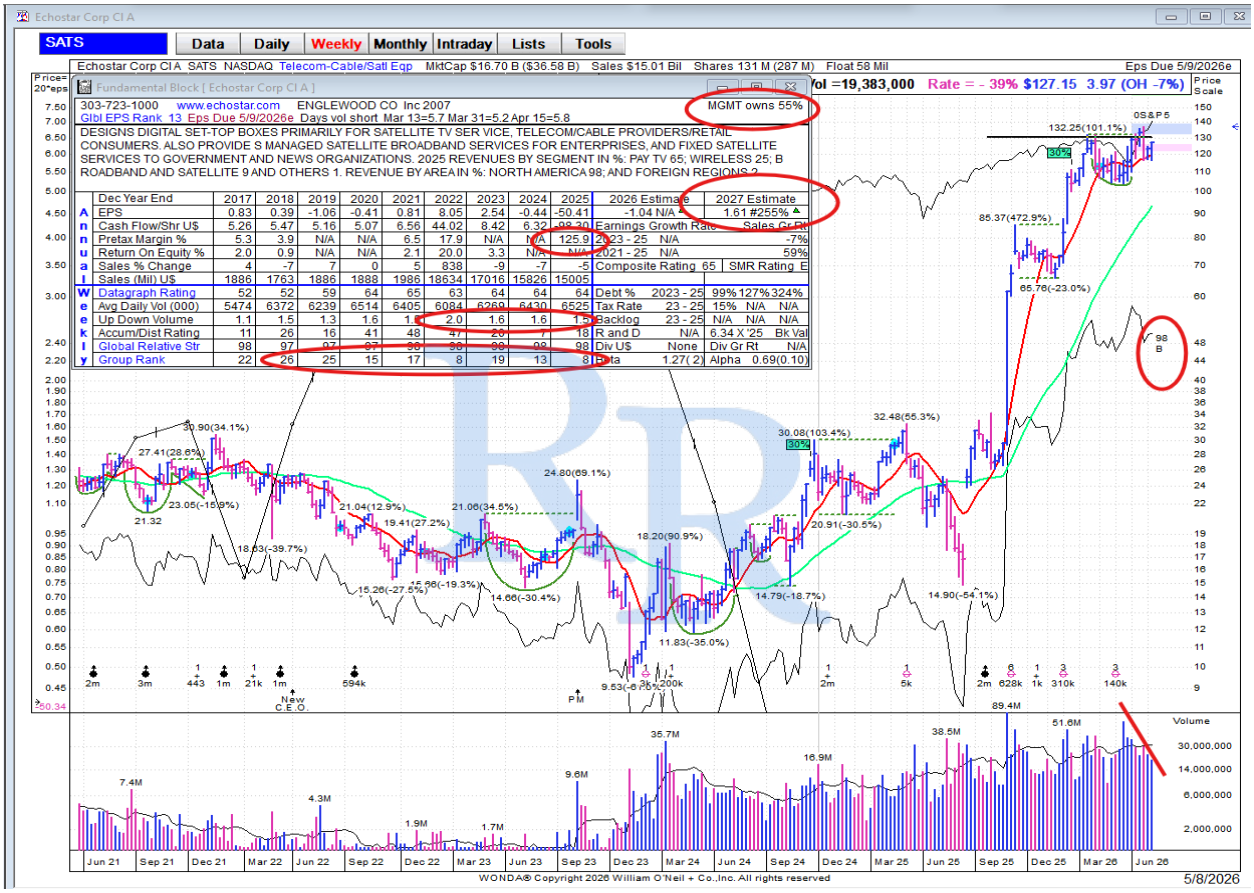
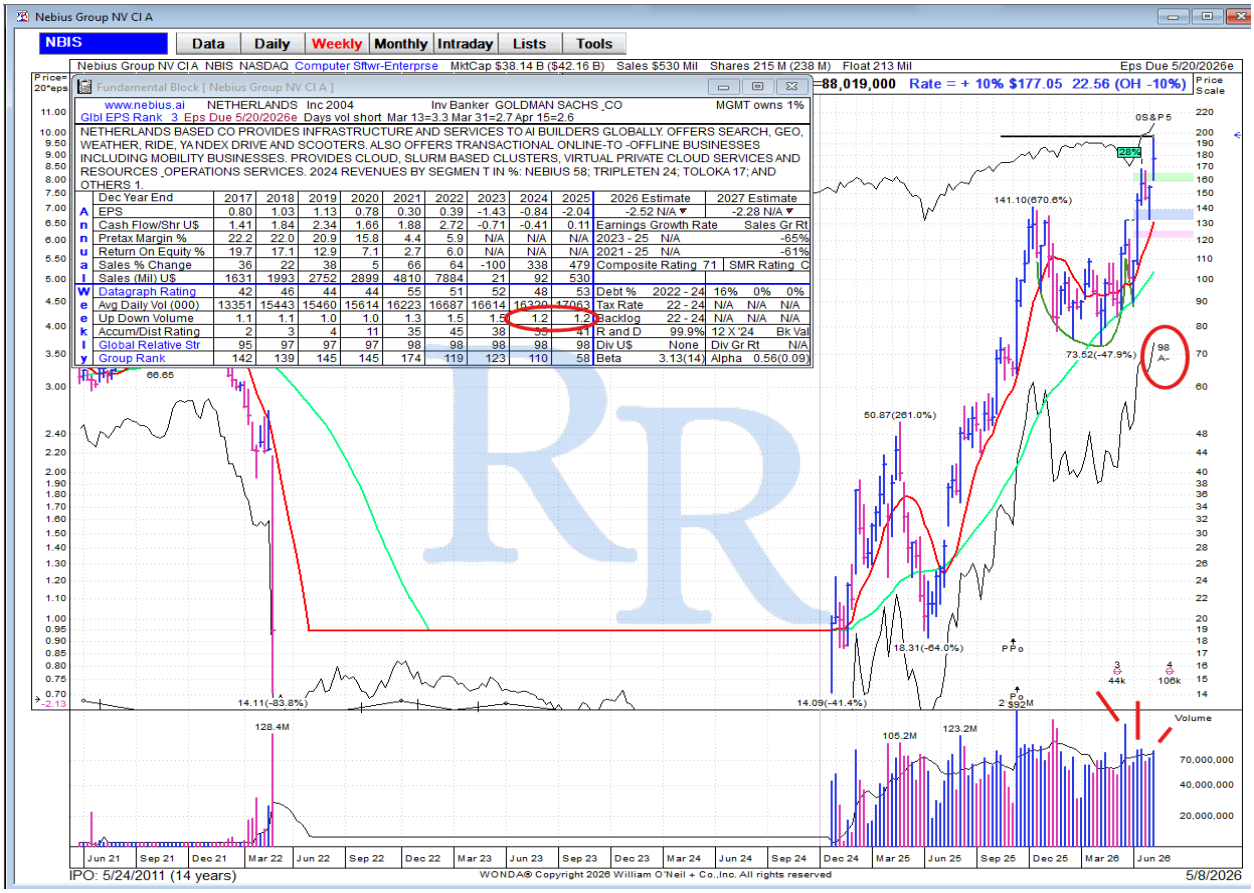
TSLA Daily



XBI: I think some of you are bored with XBI, but I still love it. Pivot over $139.30.

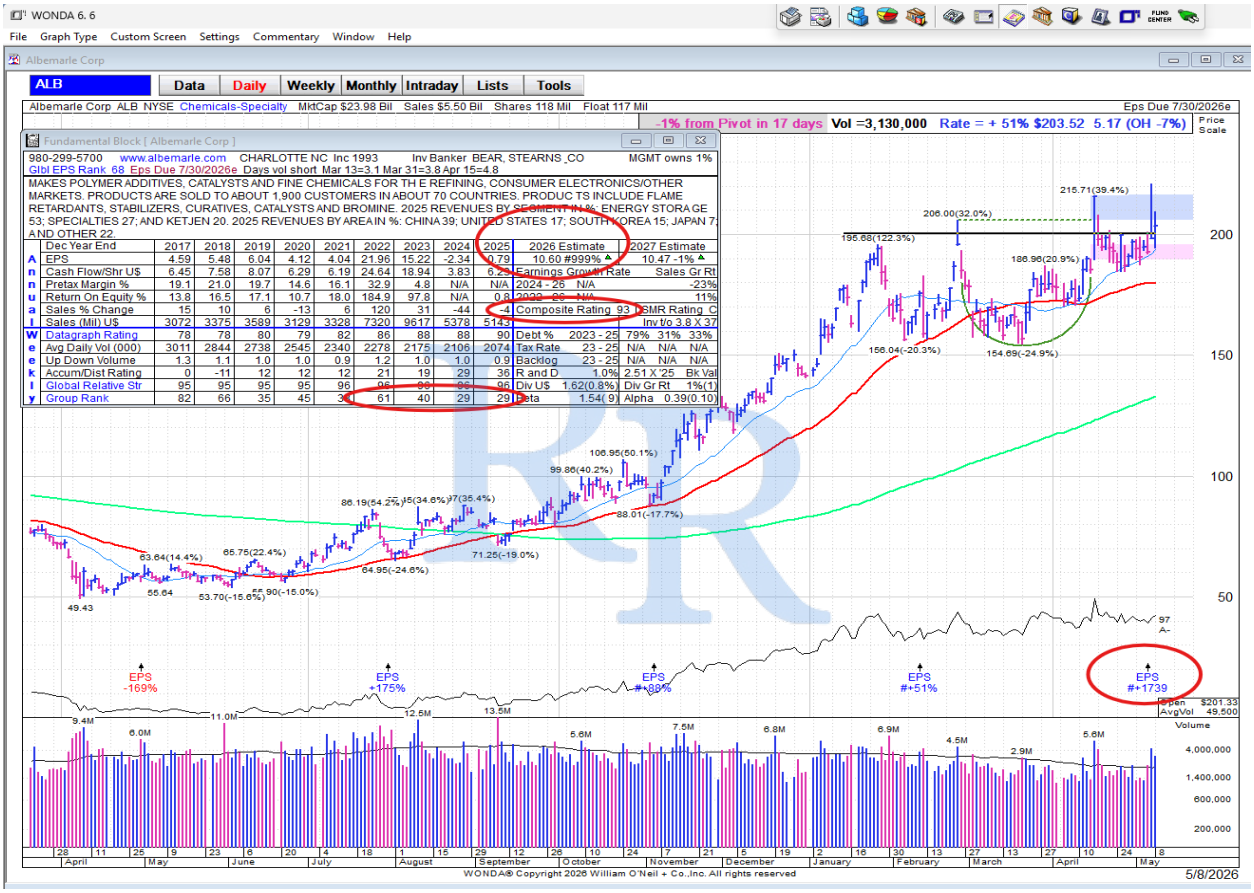


SATS: Management owns 55%, big 2027 estimate, and 126% pretax margins. Pivot over $137.55.

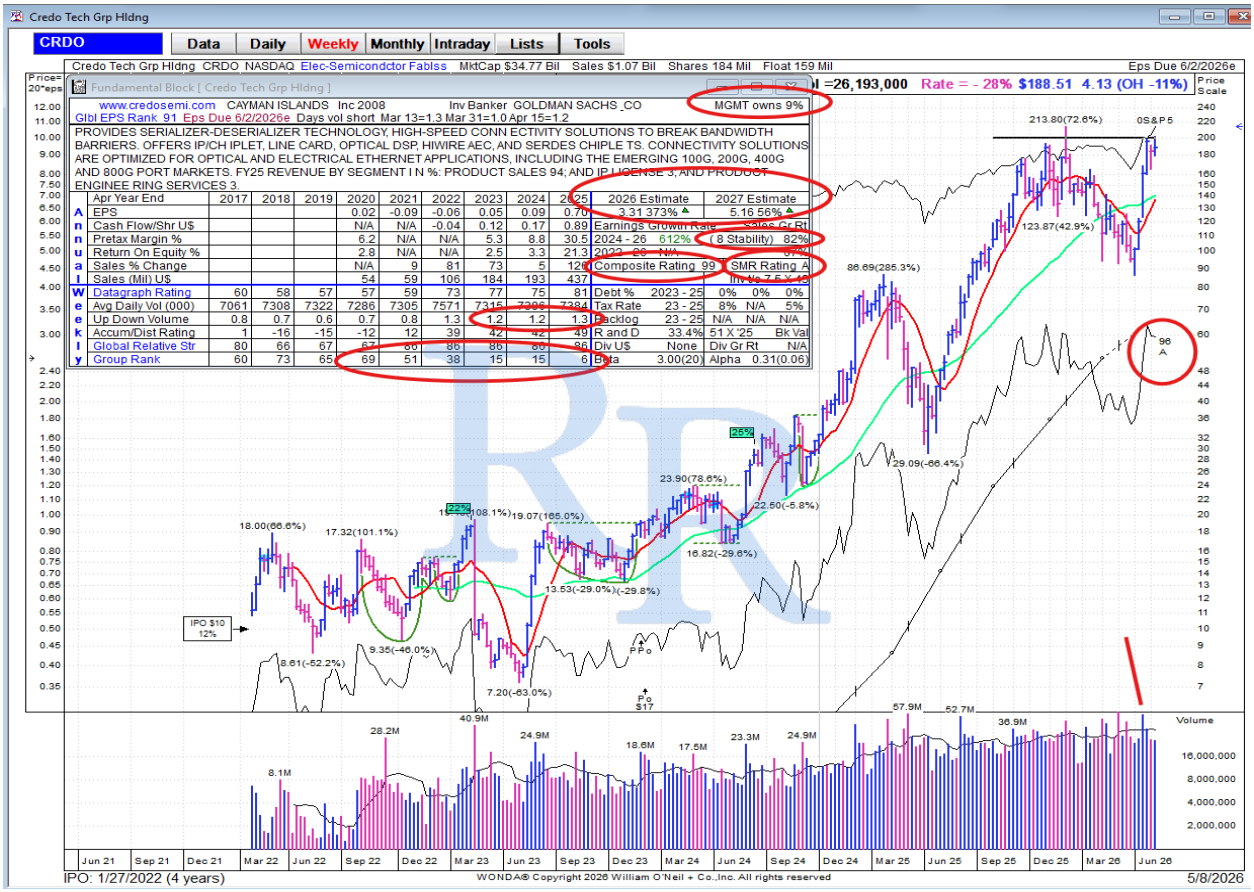


NBIS is a no-earnings cowboy name, which is likely why it's so volatile. I love the technical picture, the Skyscrapers of Blue Volume Accumulation (SOBVA) and Walls of Blue Volume Accumulation (WOBVA) are impressive, as are the compute demand fundamentals. Small adds could be made right here, just over the last three weeks support highs.

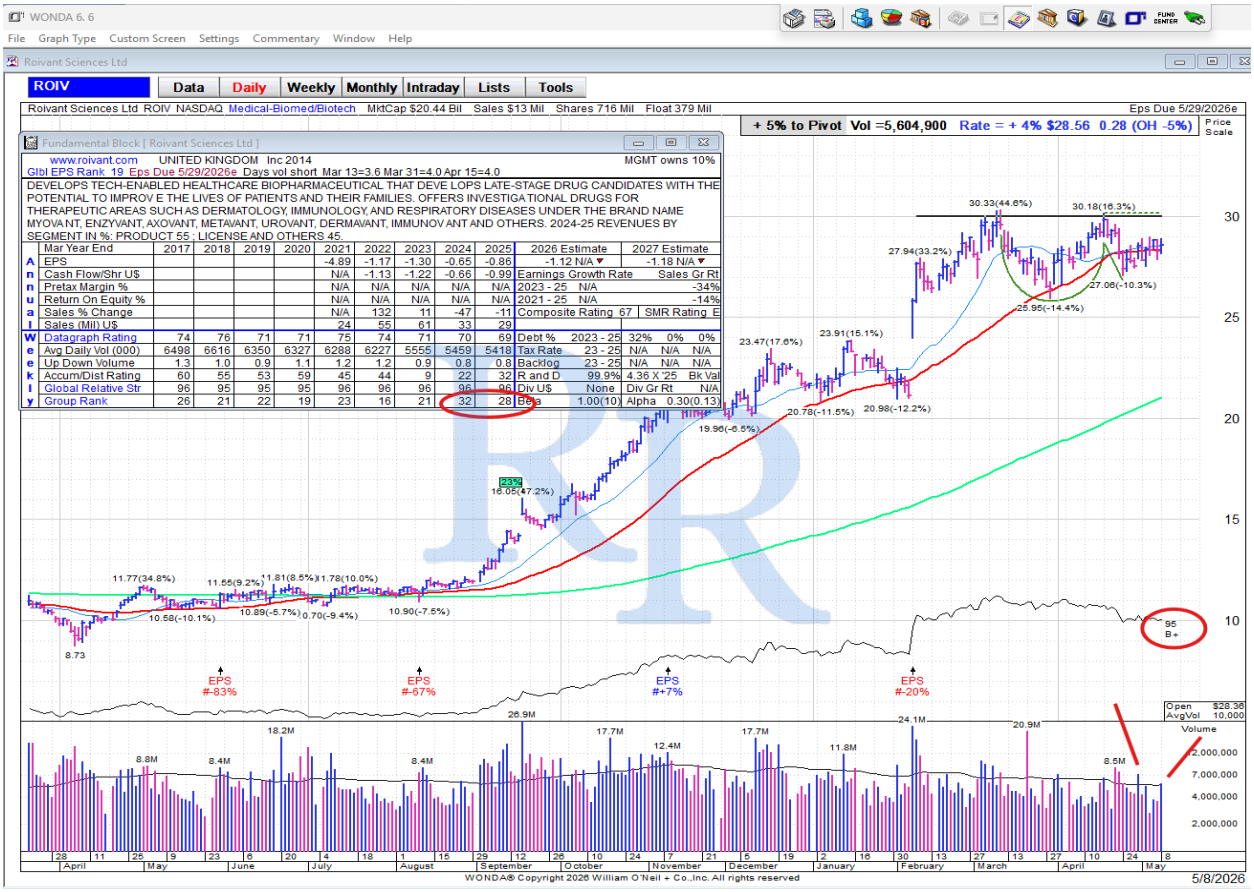
CRWV (Thill, Buy, PT: $160) *We're out with a 1Q preview for CRWV ahead of the co's print on Weds. CRWV announced three deals in Apr, a $21B expansion with META, a deal with Anthropic (value not disclosed) and a $6B deal with Jane Street. We est. these deals, combined with the Perplexity deal announced in Mar, bring the total backlog to >$95B vs. $67B last Q. Meanwhile, our checks indicate continued strong demand/pricing for GPU compute. As a result and given the co's strategic importance in the multi-$T AI oppty, we believe the current valuation of ~13.3x our rolled-forward EV/CY28 EBIT is compelling. Our revenue estimates for '26 & '27 are ahead of the Street.*



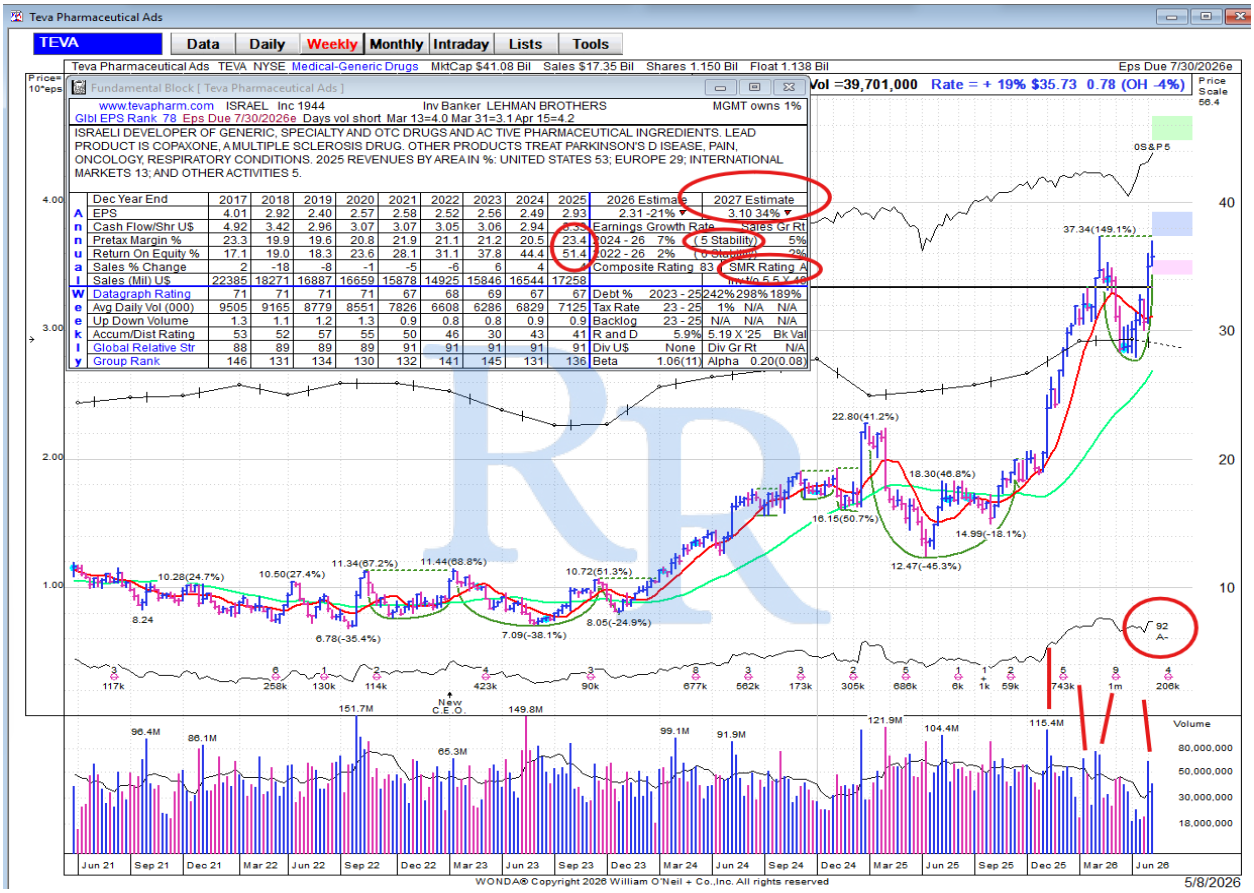
ALB does not have high-octane performance yet, but it does have Explosive High Octane +1739% EPS growth. ABL has a funky, erratic, chart personality, but I think chemicals are becoming an important story. Actionable right here. SQM is also in gear.



CRDO: I find it hard to force myself to buy new breakouts into such an extended market, but CRDO warrants action, if, if, if it has a high-volume breakout over $200ish, which it tried last week but did not attract any buying. That is a red flag. 96RS, 98 Comp!!!!!!!!

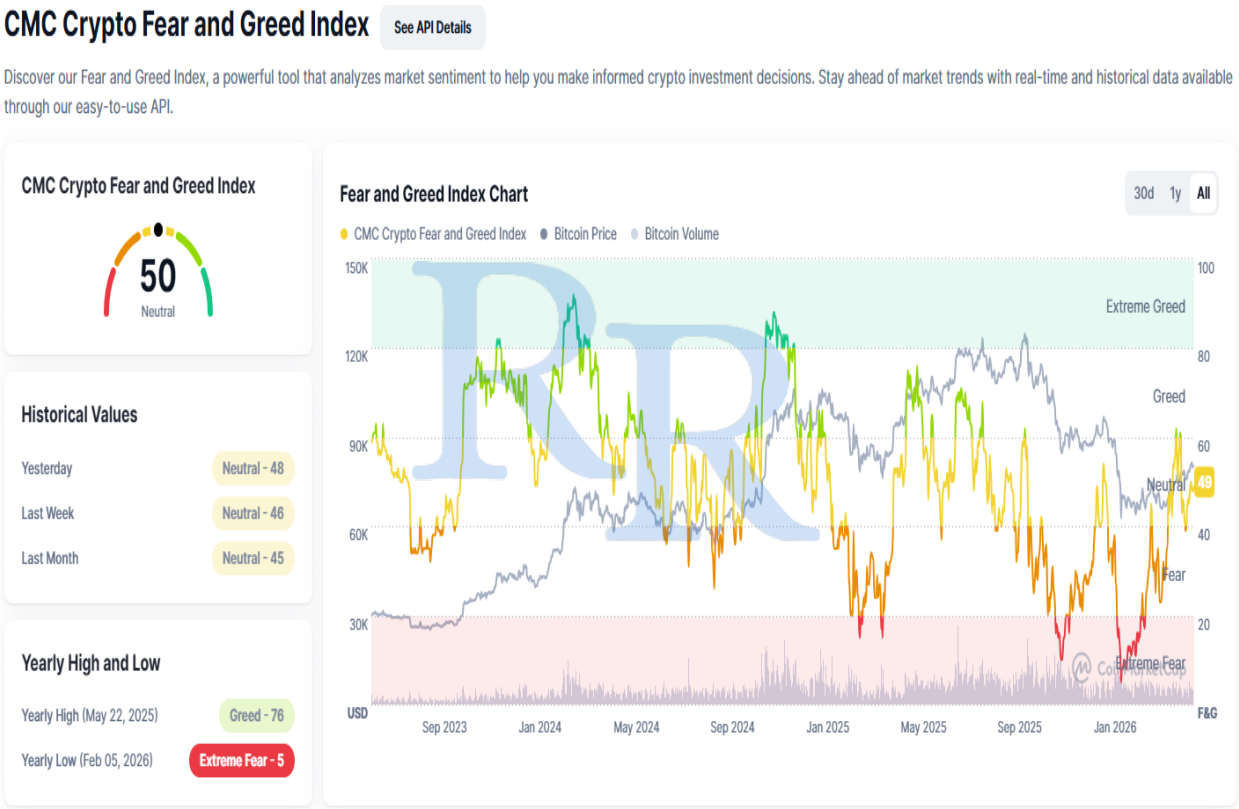


ROIV: Pivot over $30.25ish.



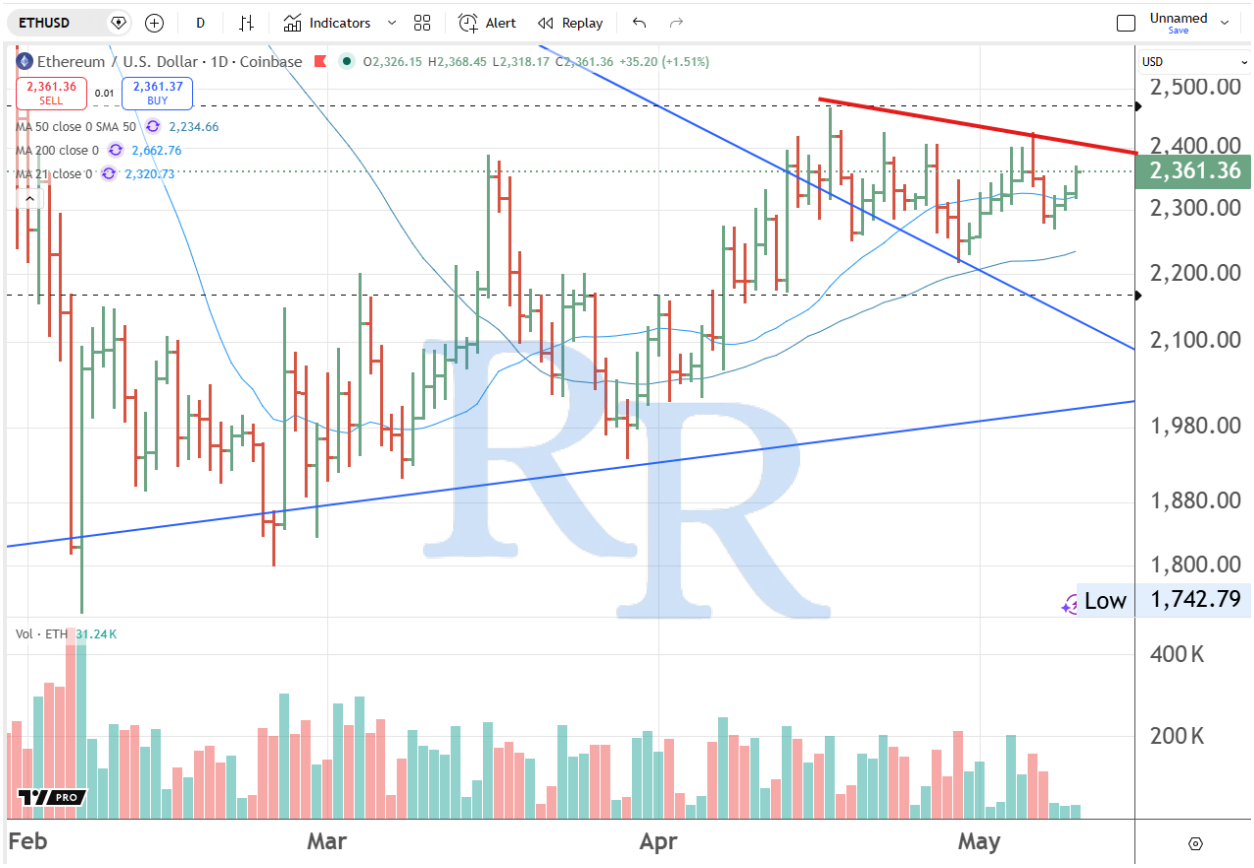
TEVA: Second stage base in progress. Wait for a handle.

▼ Crypto



There are nearly no signs of excess in the crypto space right now.

BTC is subtly drifting higher as it seems to be ignored, as AI has stolen the show, and many have given up after it failed to hold over $100K last year.

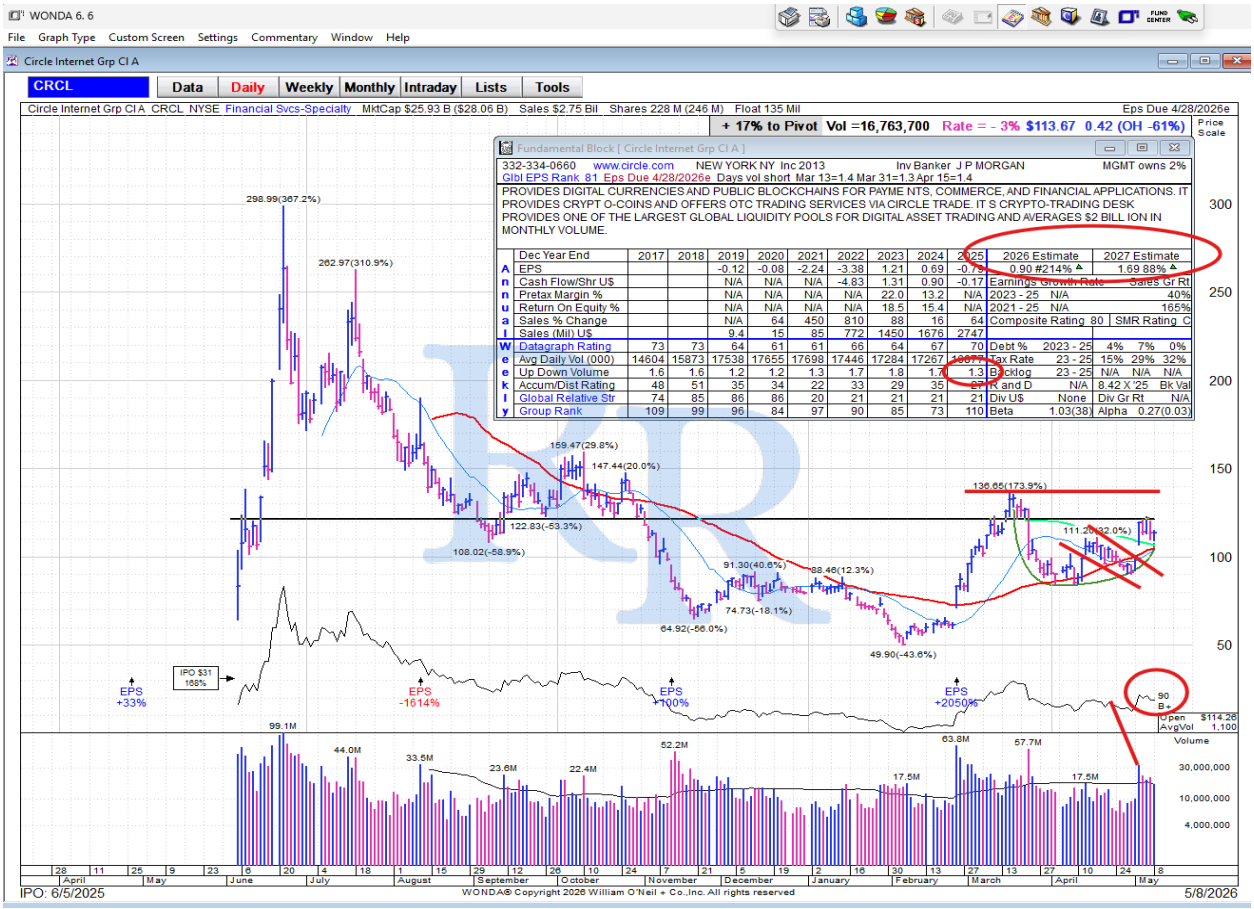


ETH has a much more constructive base in progress, pivot over $2,470ish.

HYPE remains where the RS leadership is. Pivot over $45.90.

TRON gets an honorable mention. Needs a handle.

ICP is trying to re-engage. Escape velocity is likely over $5.00.



CRCL: I am wowed by CRCL's tight down-sloping channel through April and then the SOBVA gap above it. I also consider the stablecoin adoption fundamental story to be the biggest opportunity outside of AI. First pivot over $123.00, second pivot over $136.75. The overhead from last year is not ideal, but it's getting stale.

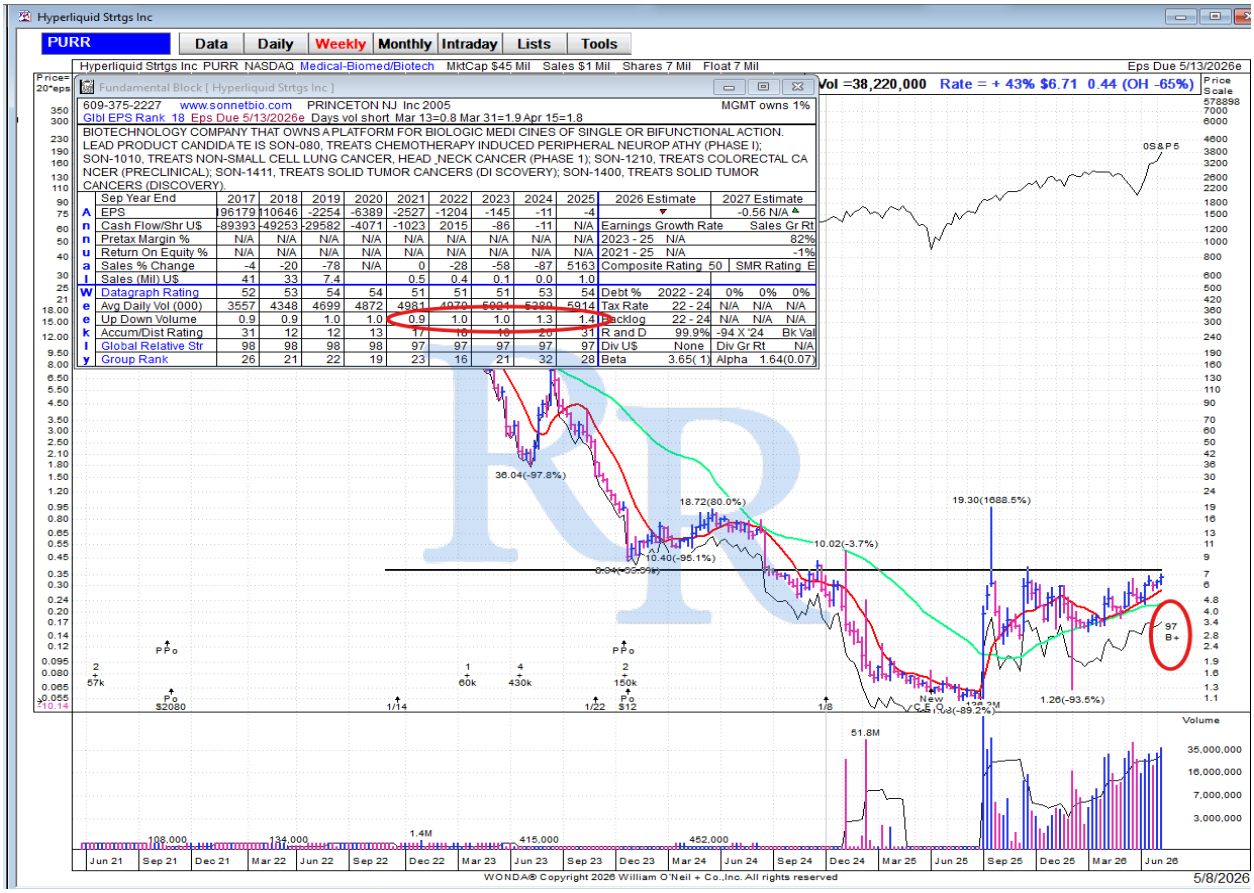
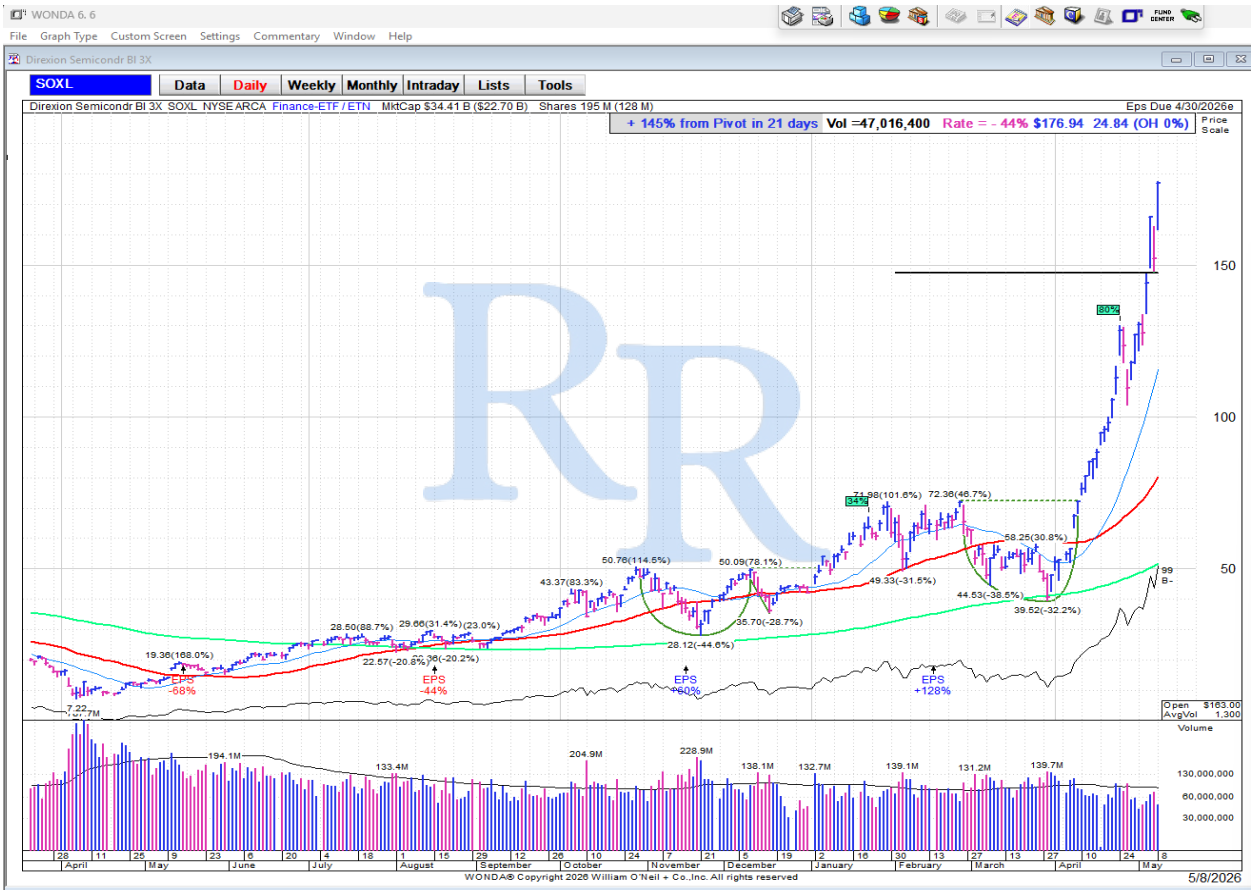
CRCL: +168% EPS beat, T Rowe and FIDO are sniffing around.

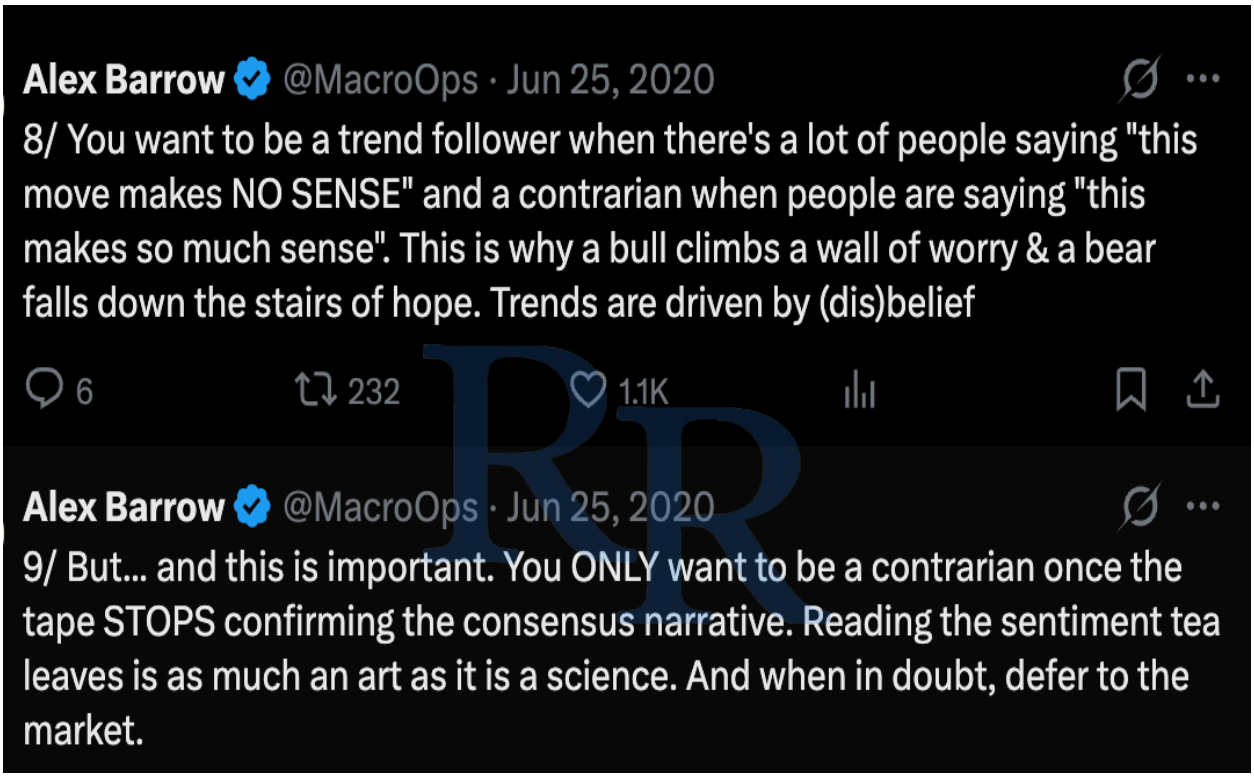


PURR has SOBVA, U/D rising, pivot over $7.20.

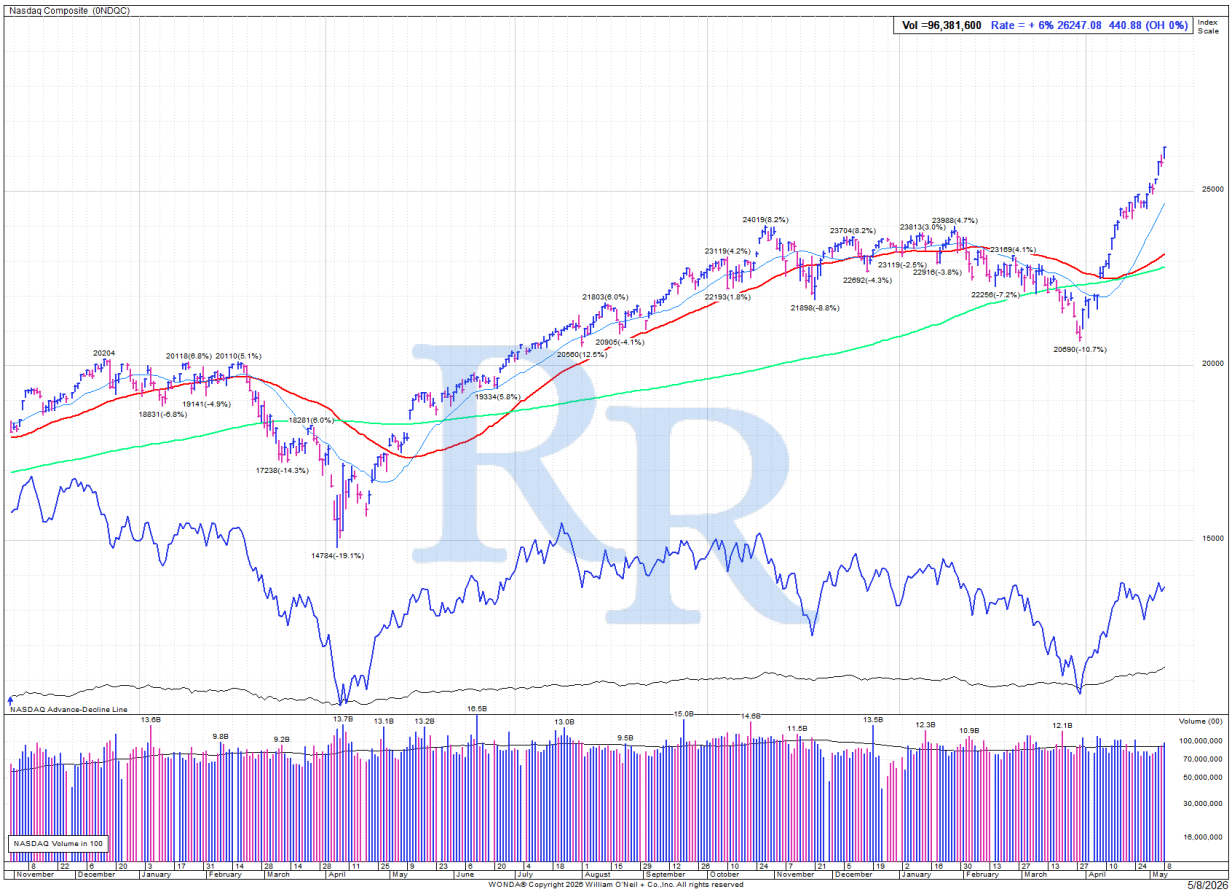
▼ Market, Indexes, Indicators, and Dominant Factor Charts



SOXL: I am well aware this is a 3X levered ETF, but *nothing* expresses the INSANE historic market we are in more than this chart. There's 10% odds SOXL soars meaningfully higher, and 25% odds it digests dead tight, and if, if, if it does, it will make me raging BULLISH. There are 65% odds that it digests lower and possibly lower.



For now, price action is still bull friendly. However, the AI memory-shortage story is now so widely accepted that these names are increasingly treated as secular growth stocks rather than cyclical commodity plays. Even so, short-term excess signals are starting to flash.

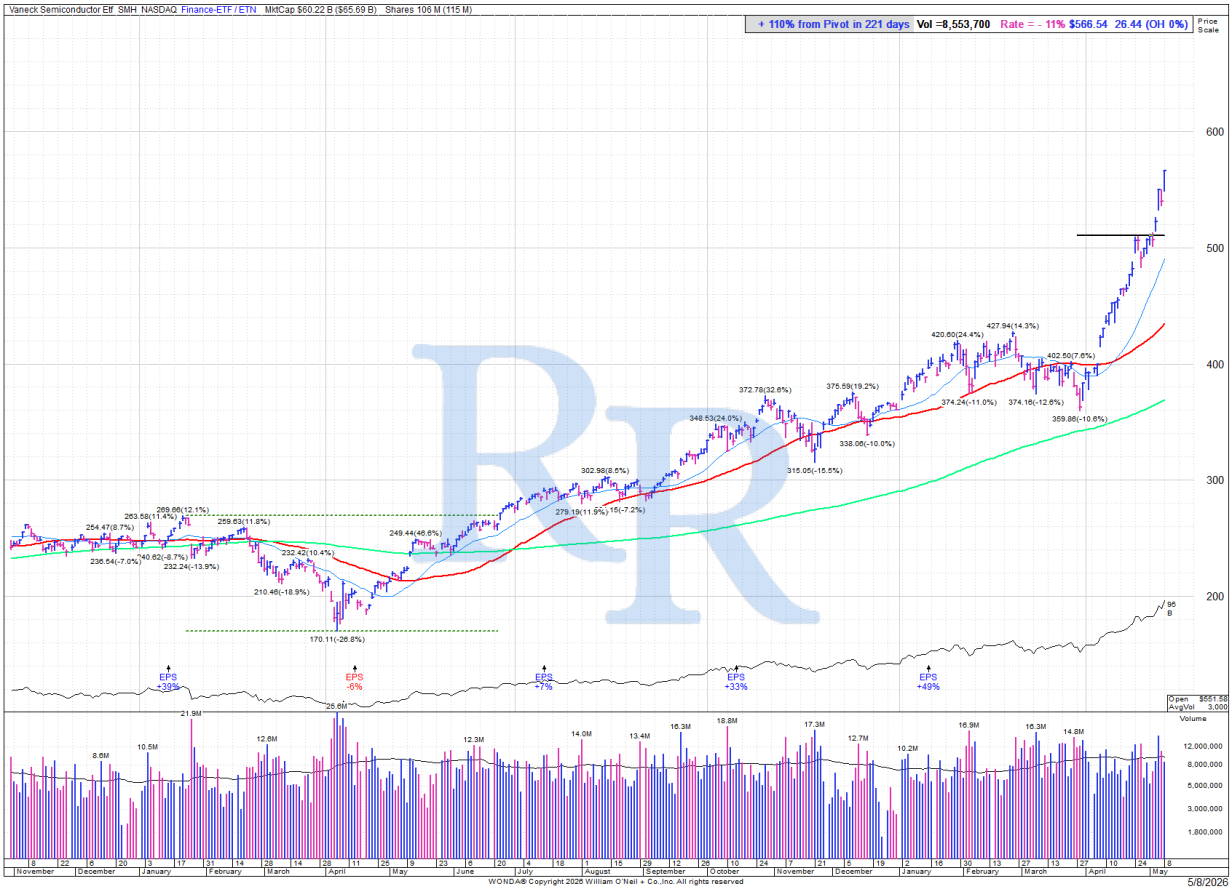


NASDAQ is now +13% over the 50DSMA. Could it get +20% or more extended? Yes, but I think that will be reserved for a final blowoff top that will precede a bear market. I don't see that now. The ultimate top will likely be fueled by rabid, giddy optimism and a white-hot IPO market. Neither of which is in place now. I think there is likely to be some near-term digestion before another leg higher, likely into Christmas. That is not a prediction, just a guess. The NASDAQ measured move is $27,310 or another +14% higher which is very doable into December.

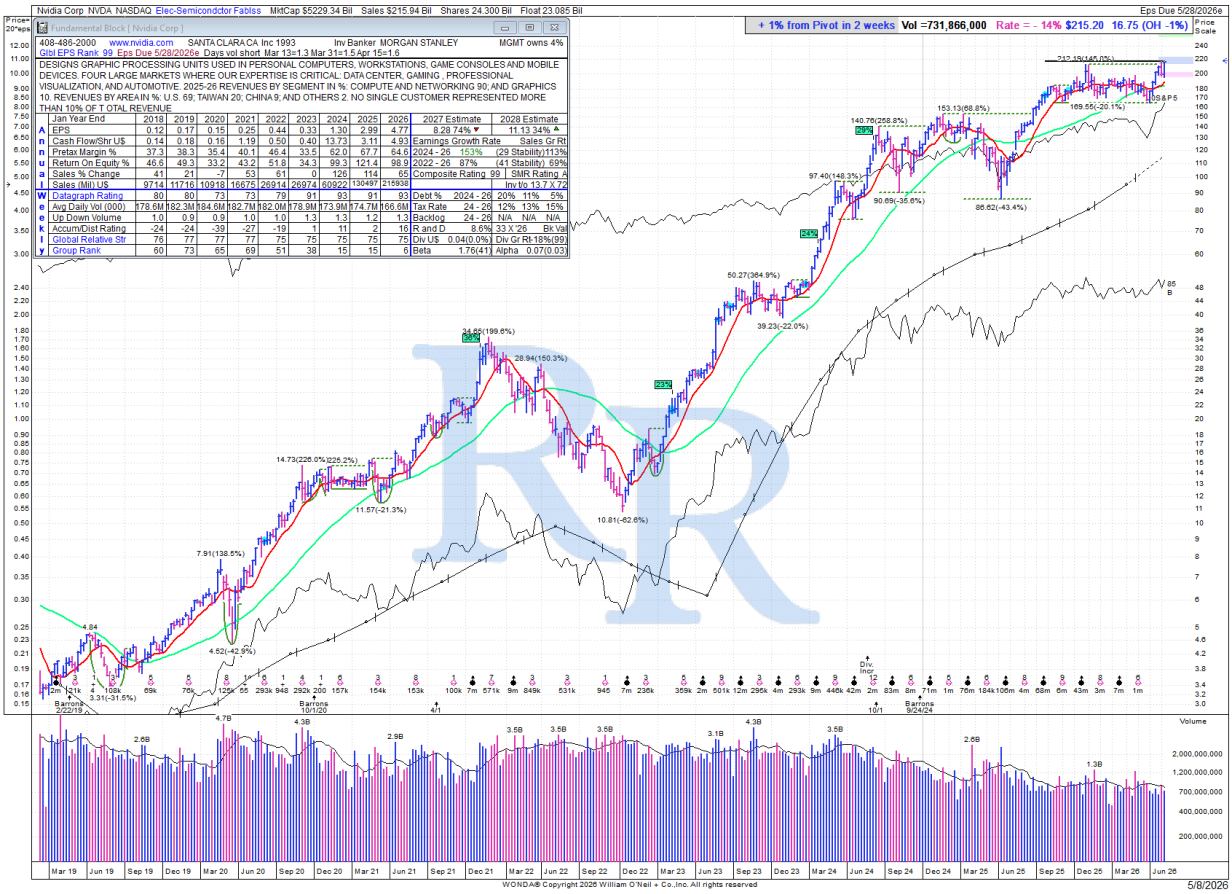
Shorting strong bull trends and excessive extension as a speculation vs hedging, without a reversal signal like a distribution or churn day, is a fool's game.

Year	Nasdaq Max Extension Above 50 day SMA	Comments
1997	12%	
1998	16%	
1999	21%	
2000	21%	
2001	17%	
2002	15%	
2003	12%	
2004	8%	
2005	6%	
2006	7%	
2007	8%	
2008	8%	
2009	15%	
2010	9%	
2011	8%	
2012	6%	
2013	6%	
2014	6%	
2015	7%	
2016	6%	
2017	5%	
2018	7%	
2019	7%	
2020	7%	Pre-Covid Bear Market
2020	13%	Post Bear -1 month into start of new Bull market as 50 Day MA started to turn up. 13% again at extremes late in 2020.
2021	8%	
2022	12%	
2023	11%	
2024	9%	
2025	10%	

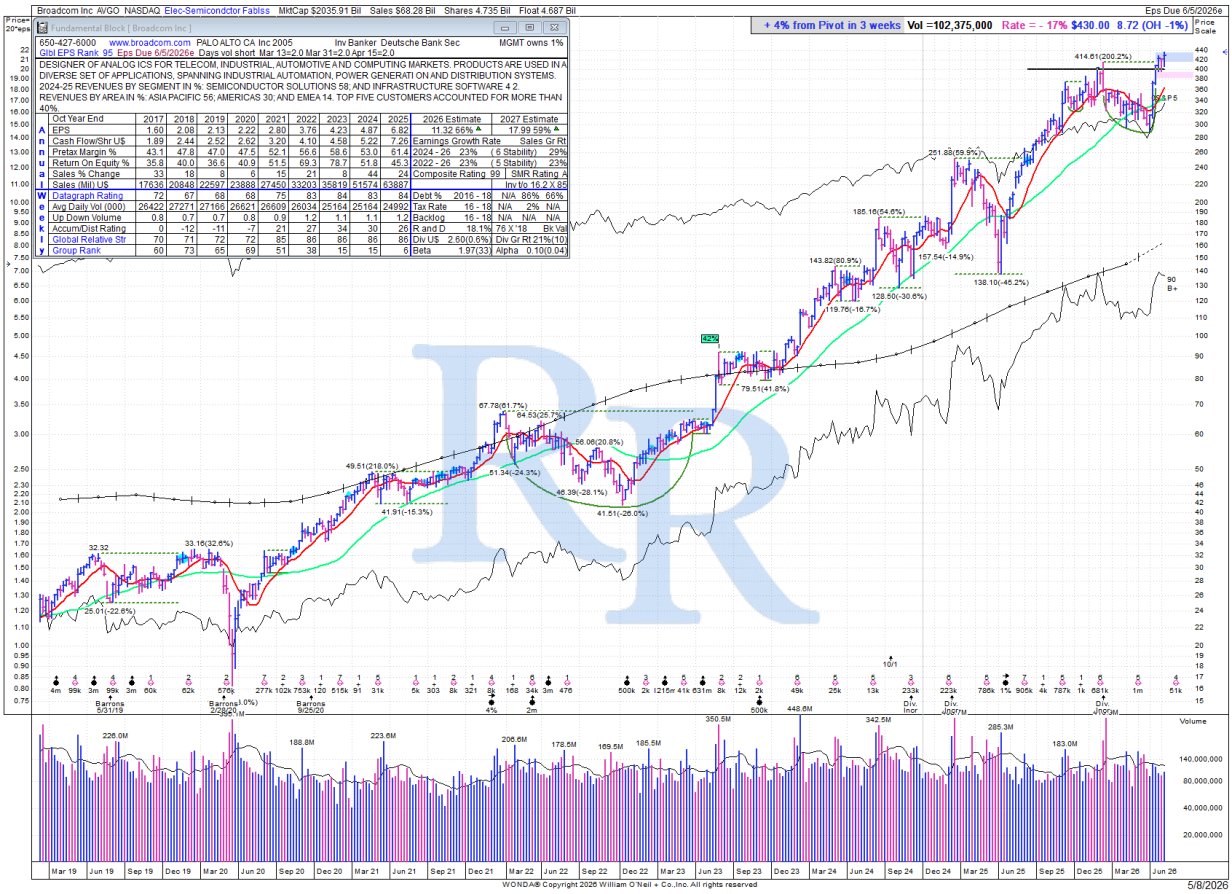
Note the fairly smooth ebb and flow of extension expansion and contraction, outside of 2009. I am convinced the current bull will culminate in 1999-2000 +21% levels of extension, and if we are ever going to see greater levels of extension, it will be at the end of his bull.



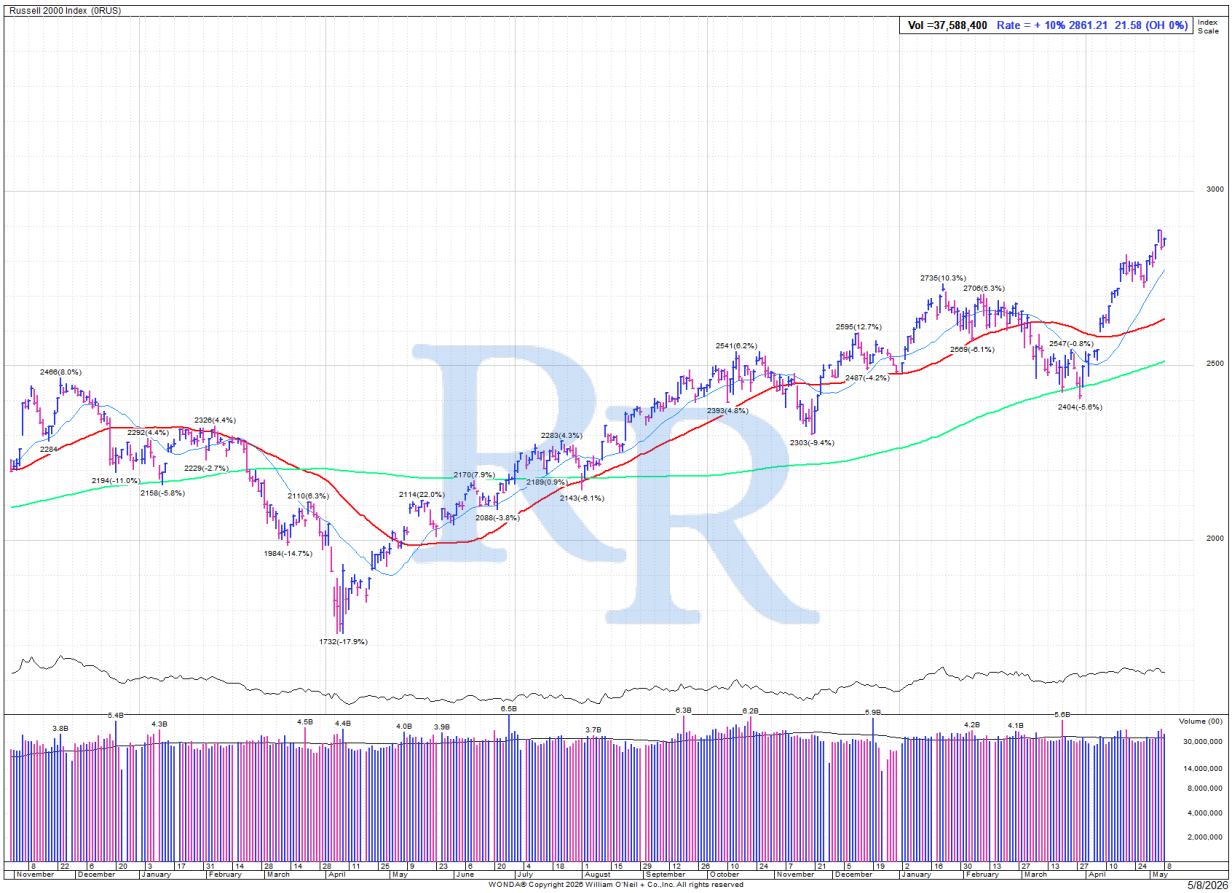
SMH is GOOFY extended.



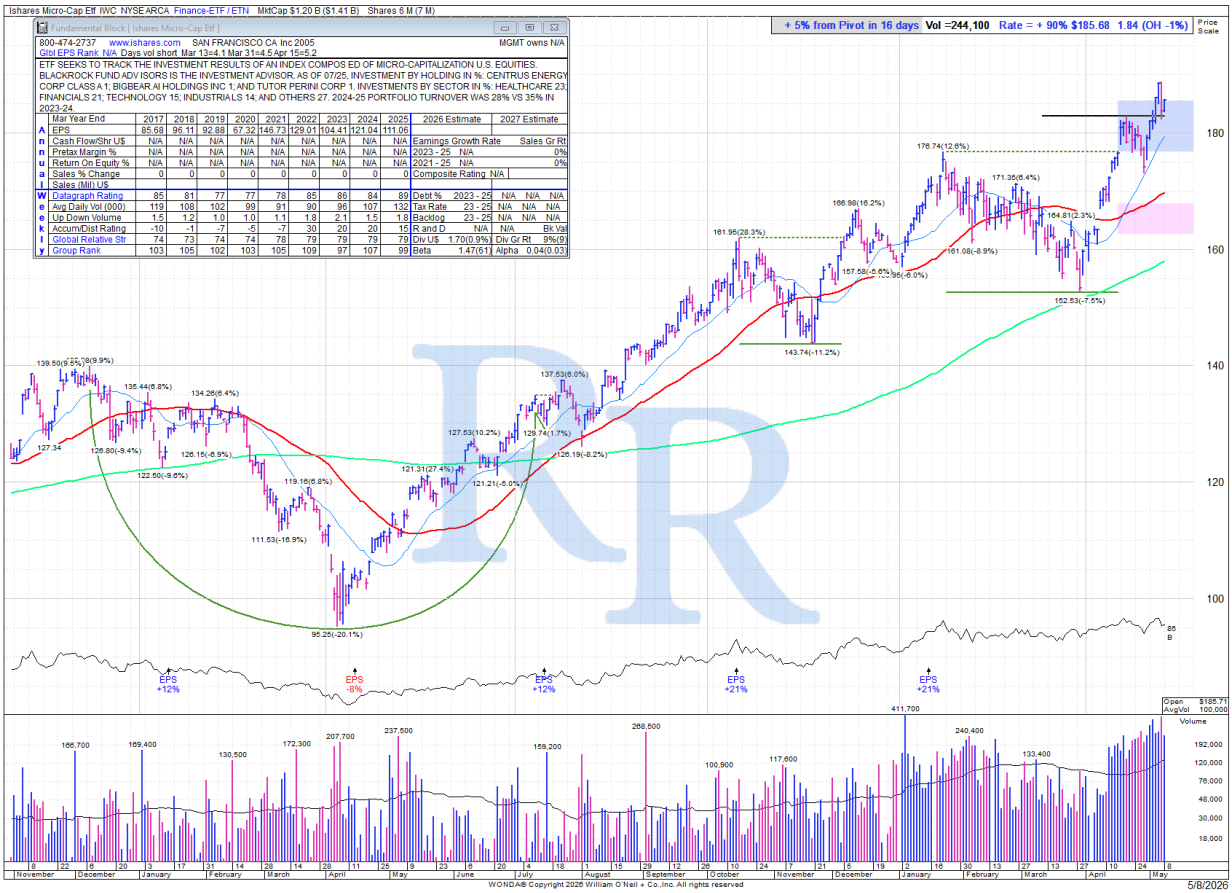
NVDA: The fly in the ointment of my short-term caution would be if, if, if NVDA violently breaks out into new highs. Pivot $217.00. *If, if, if* that occurs, the show goes on like "Donkey Kong" or, as Sarah would say, "Resume Play." I am ready for anything. Upon further review, this is a very bullish chart and tempers any general market bear case. All eyes on NVDA next week!!!!!!!!!!!!!!!!!



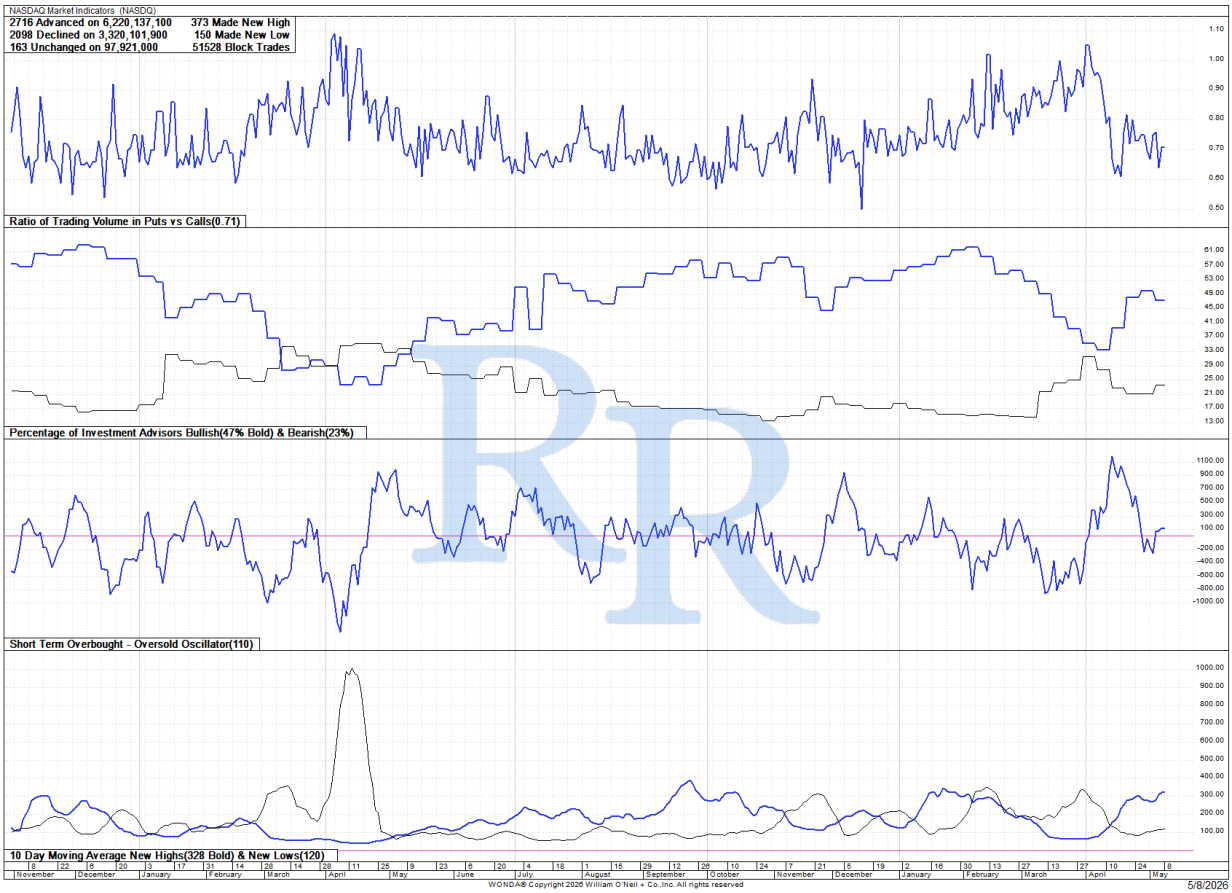
AVGO is just emerging over two weeks, 2WT, which is encouraging. Maybe I am too bearish.



RUSSELL 2000 is just emerging over a beautiful digestion with a shakeout below the $2,741.00 low on 4/29/26. NASDAQ may cool as $$$ rotates into the Russell.



IWC mirrors the Russell 2000. Over the highs from two weeks ago, I am very bullish on these indexes.

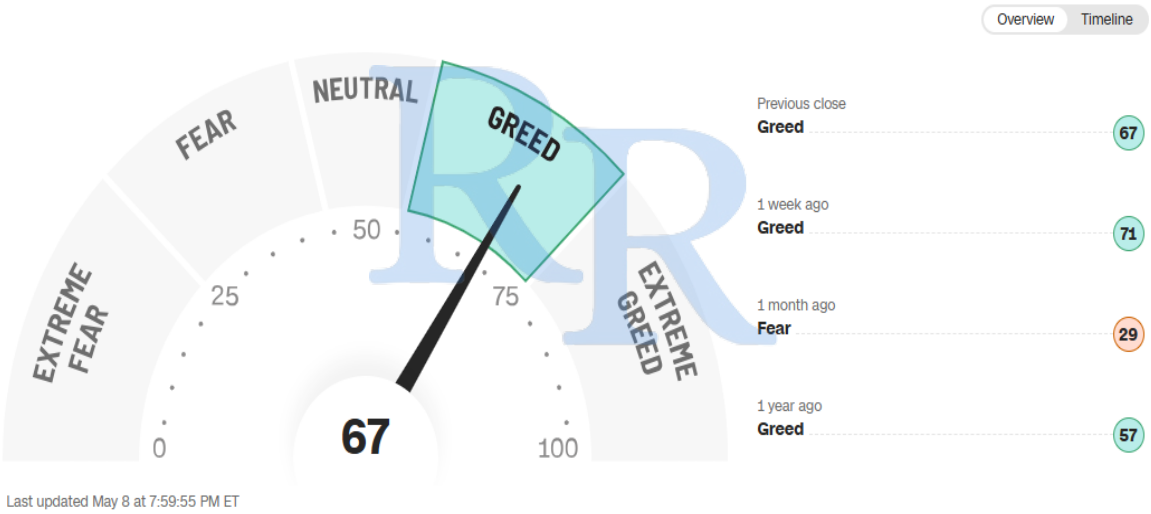


NASDQ Market Indicators: OB/OS is neutral for now.

The VIX continues to subtly trend lower but is a long way from an all-clear reading.

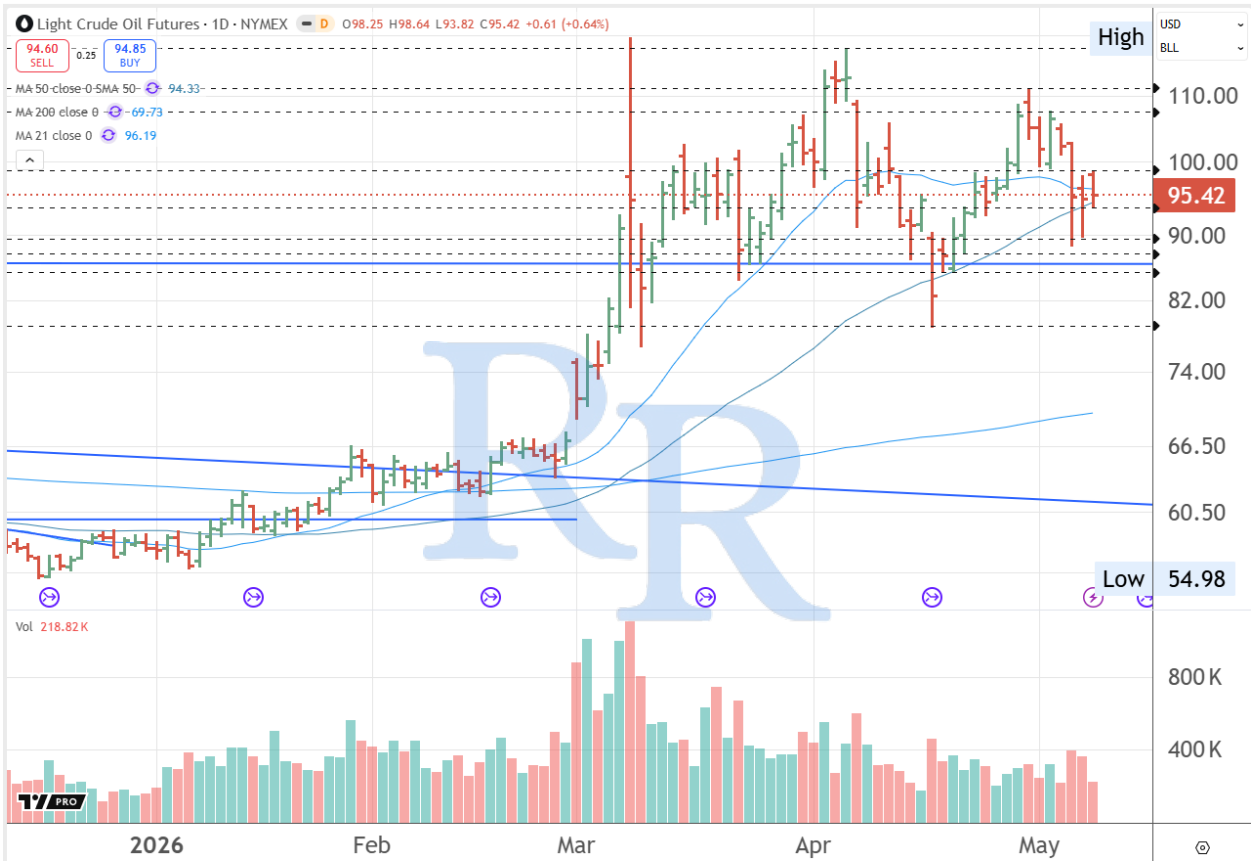
Fear & Greed Index

What emotion is driving the market now?
Learn more about the index

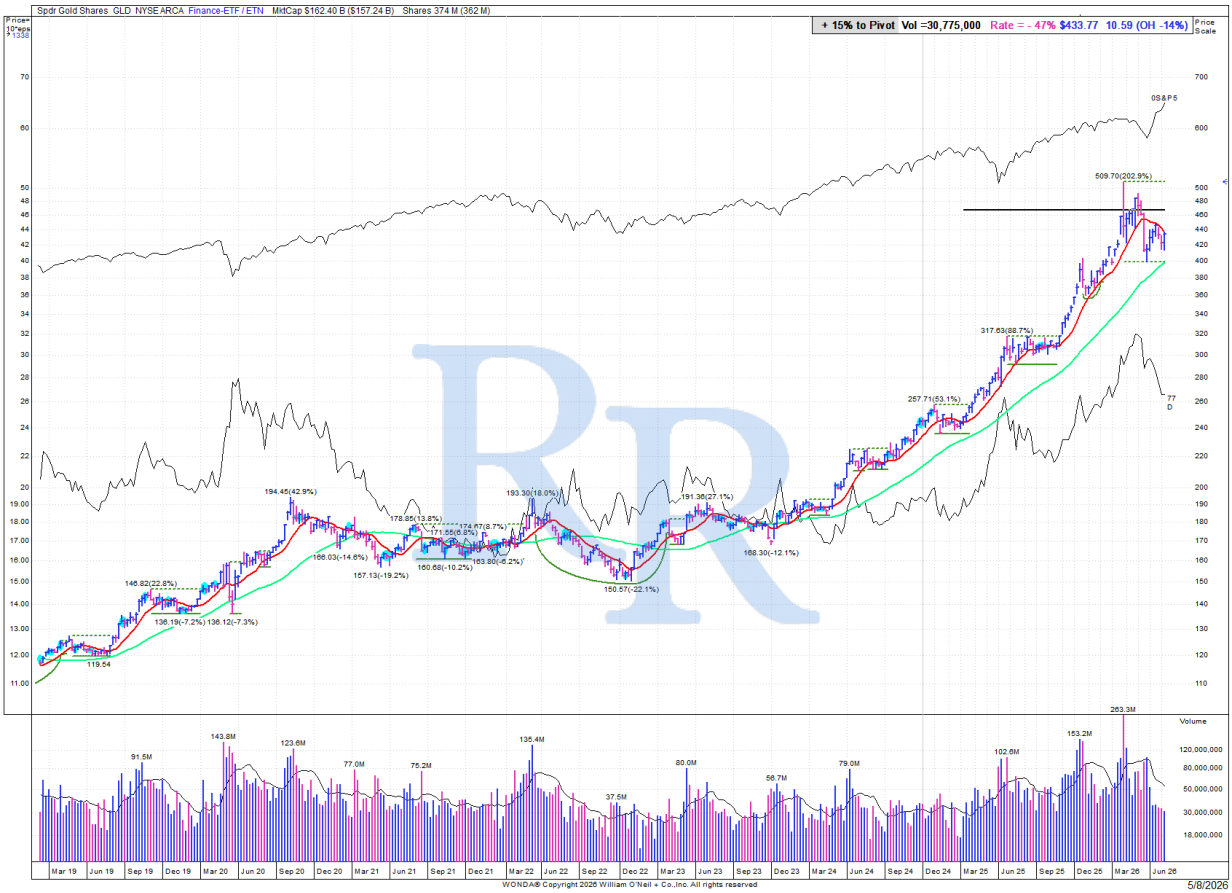


7 FEAR & GREED INDICATORS

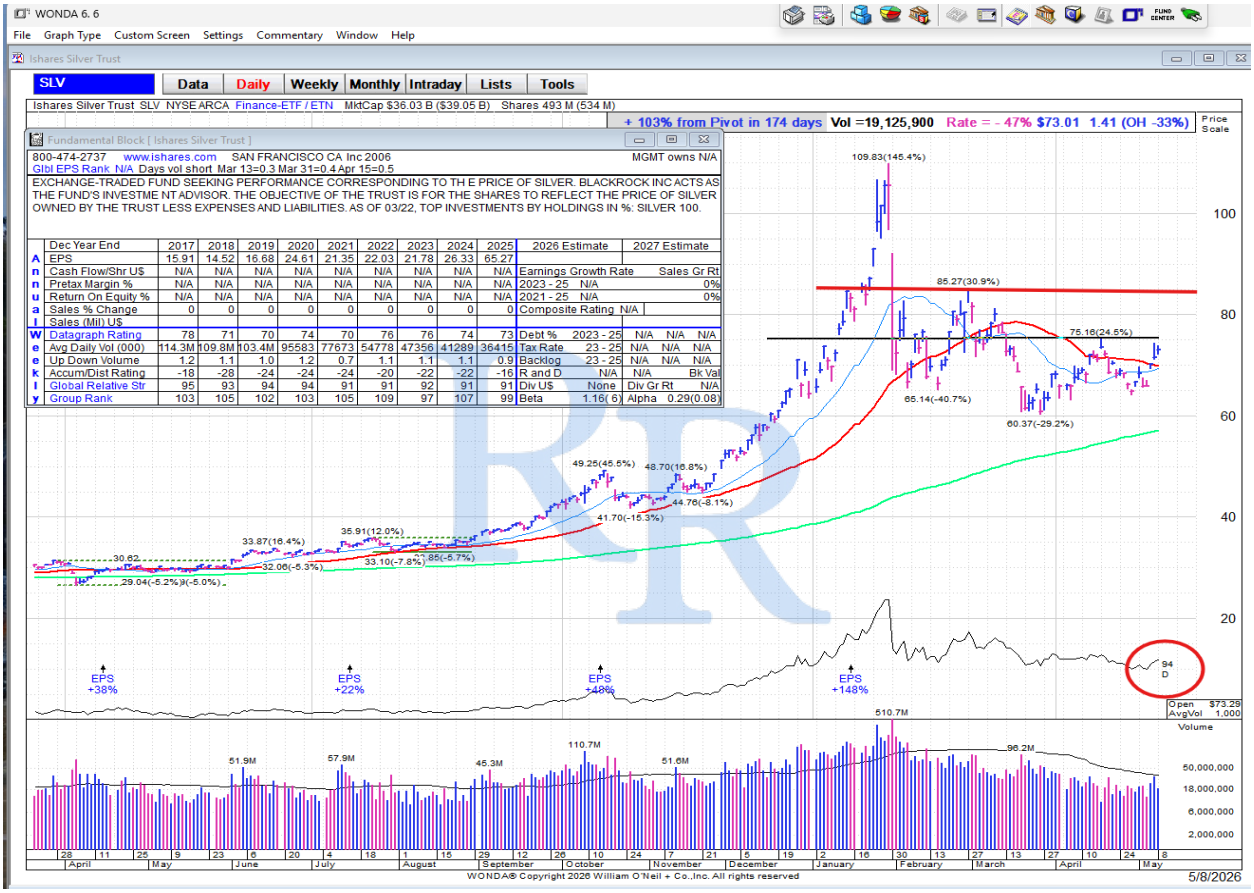
Close to broadly frothy conditions but semiconductors are very frothy.



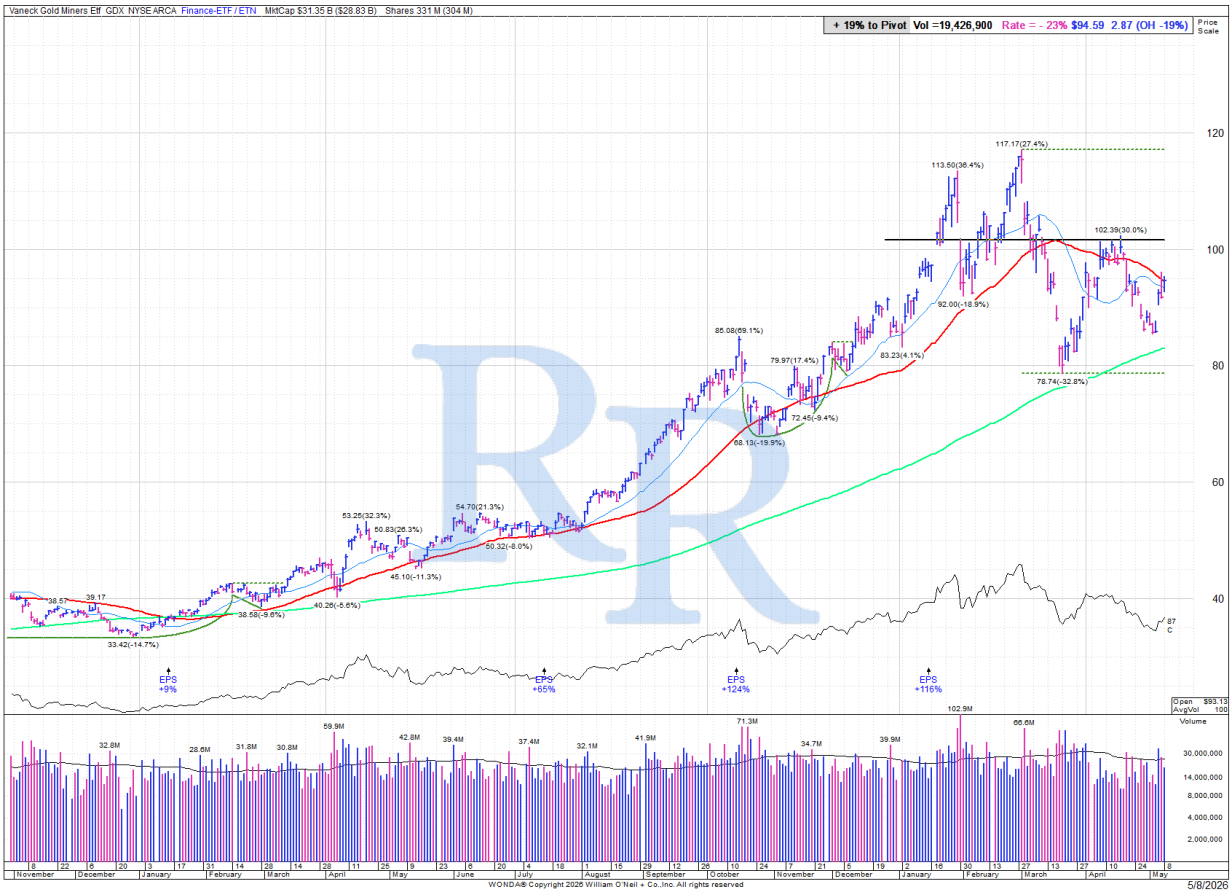
CRUDE is not bearish, $110.00 is an early pivot, and $120.00 would be "Game On," which no one is expecting.



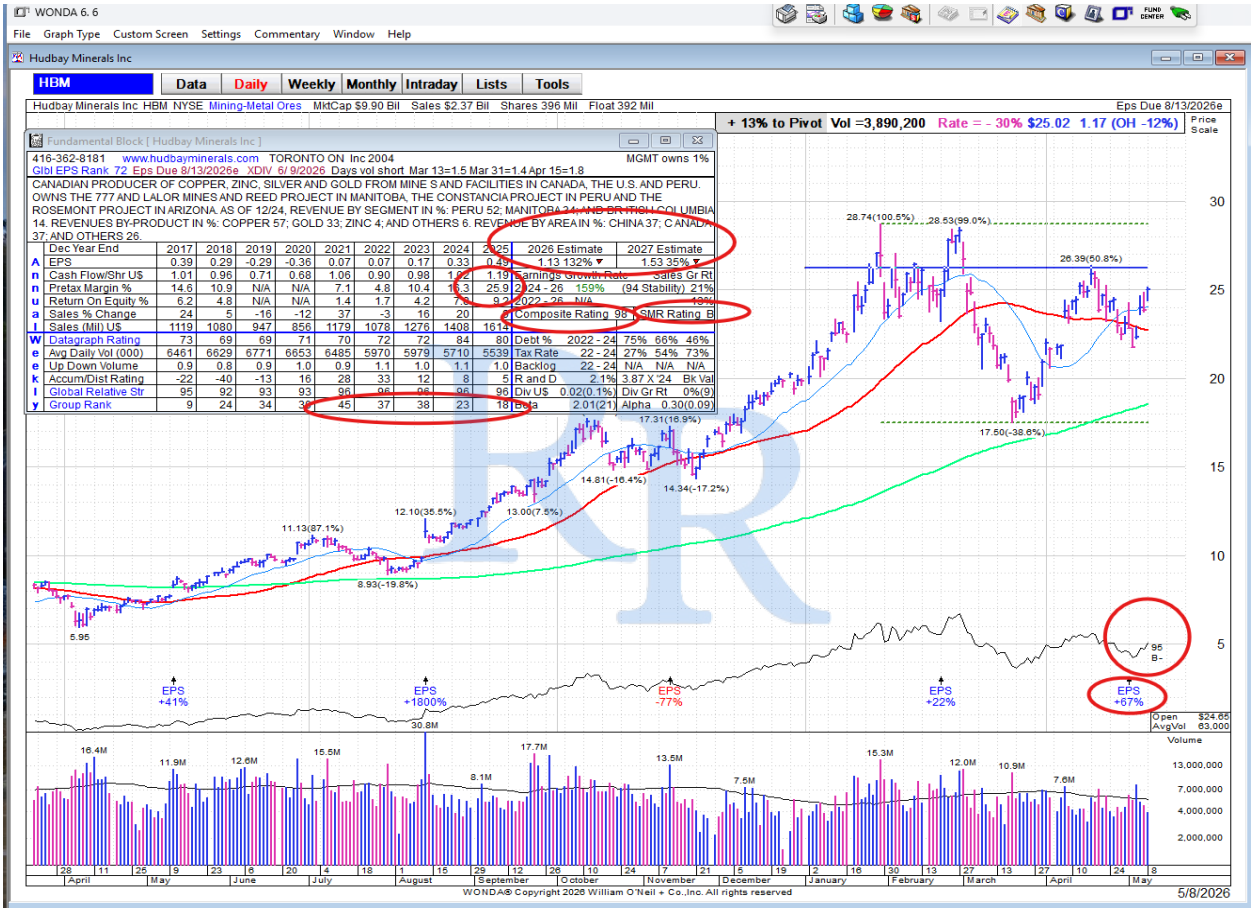
GLD is trapped below the declining 10 WSMA.



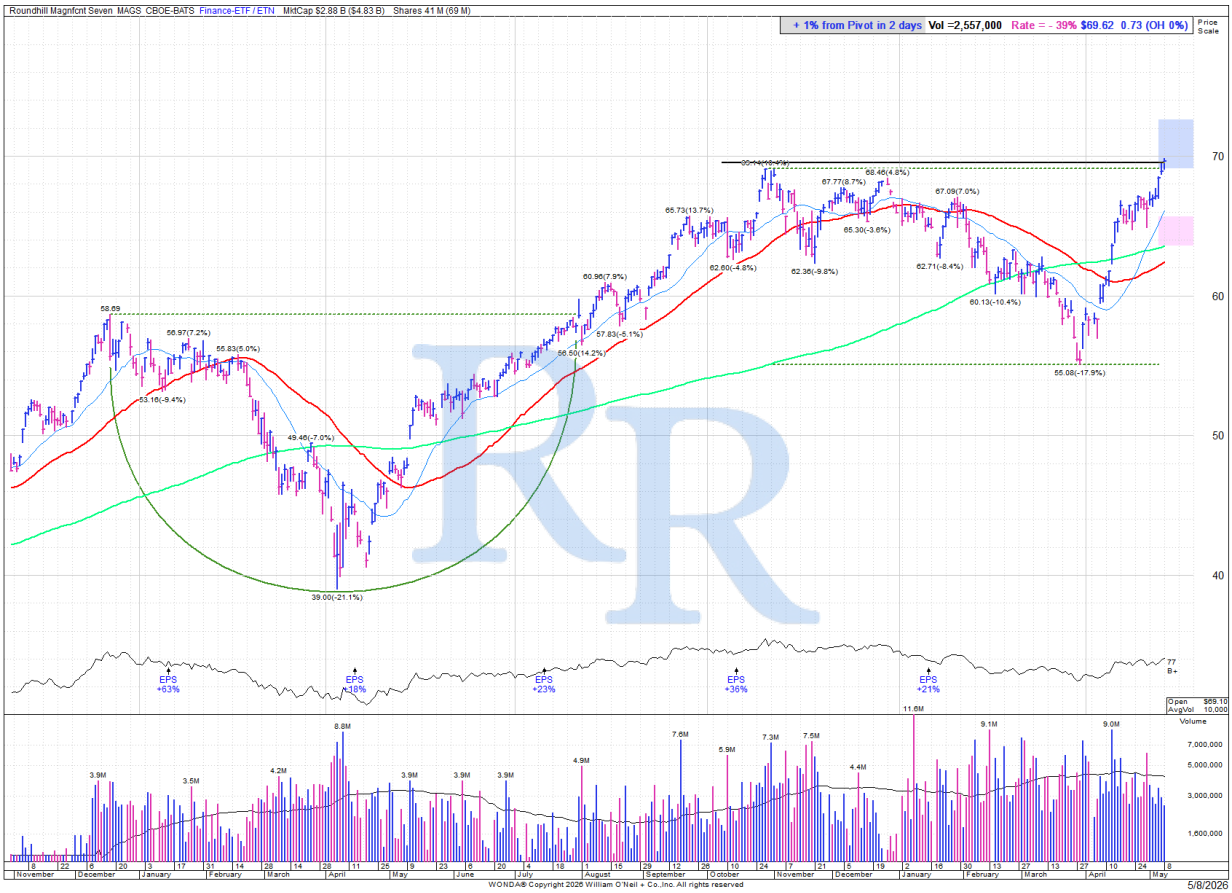
SLV: This chart increasingly tells me silver is gearing up for a second act. First pivot over $75.30ish.



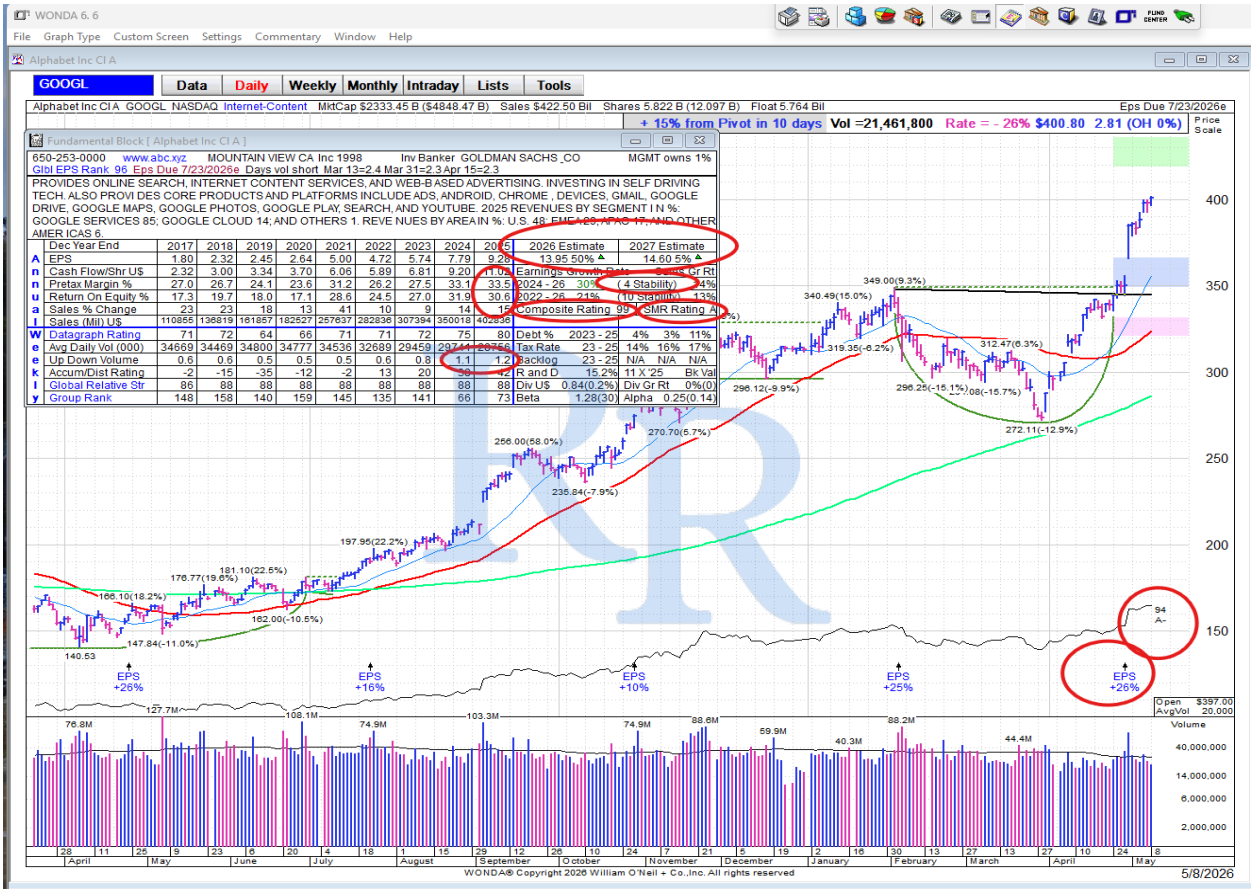
GDX is loose and choppy, but a move over $102.50 could change everything.



HBM: I am wishy, washy, on gold and the miners from week to week. If you are a gold bug, HBM looks to have the best technical and fundamental metrics, 98Comp, 95RS, pivot over $26.50. AU is also in gear.

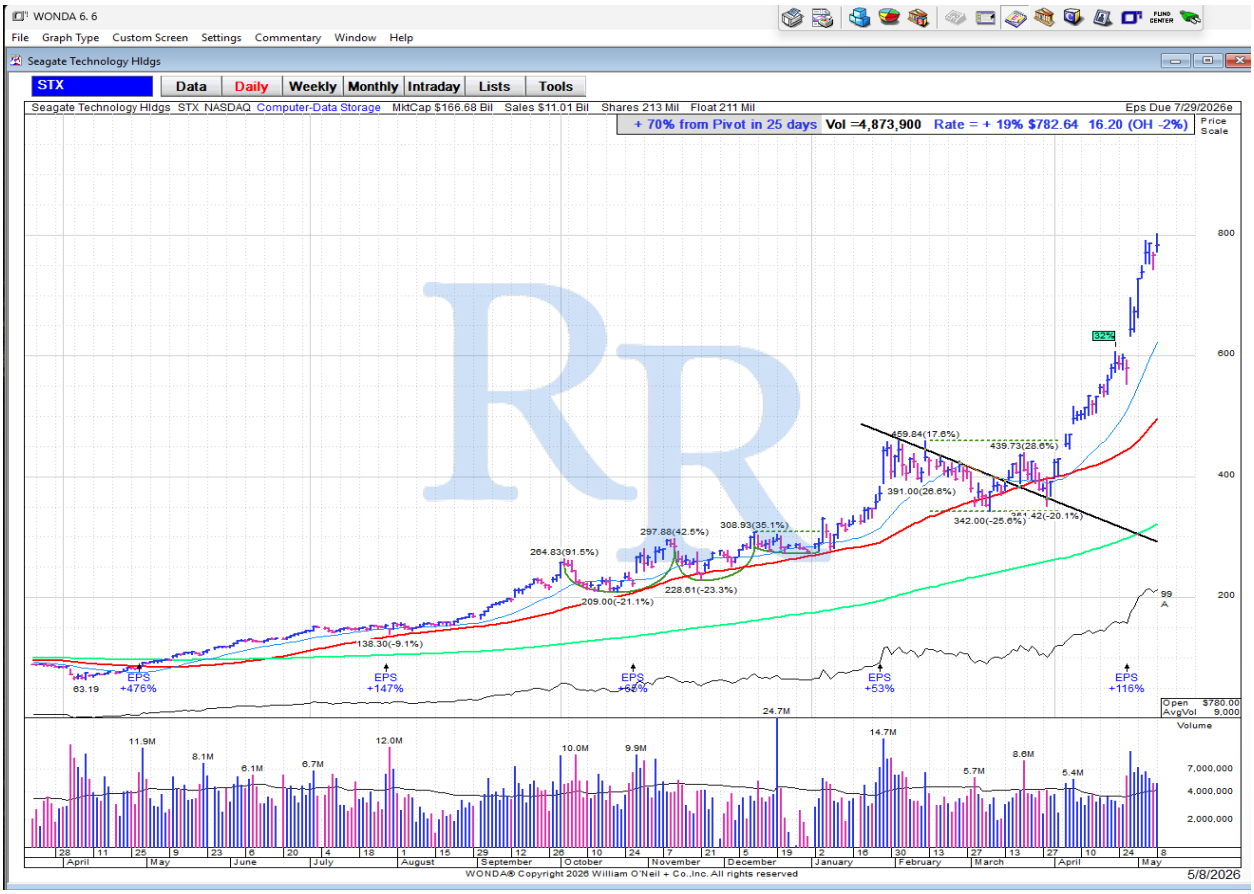


MAGS has joined the party but remains a laggard.

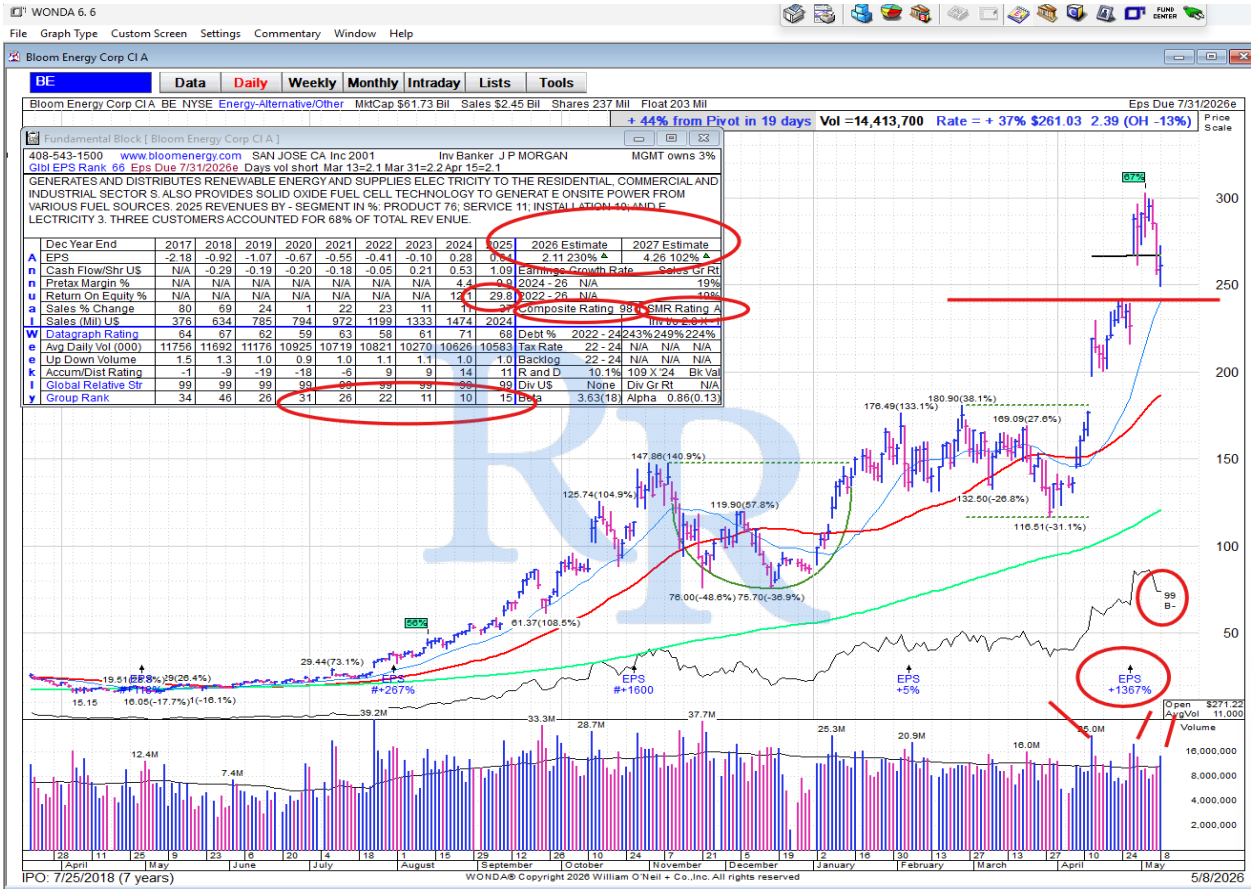


GOOG: King of the MAG7, 99Comp and now extended.

▼ Potential TMLs – Stocks of Interest

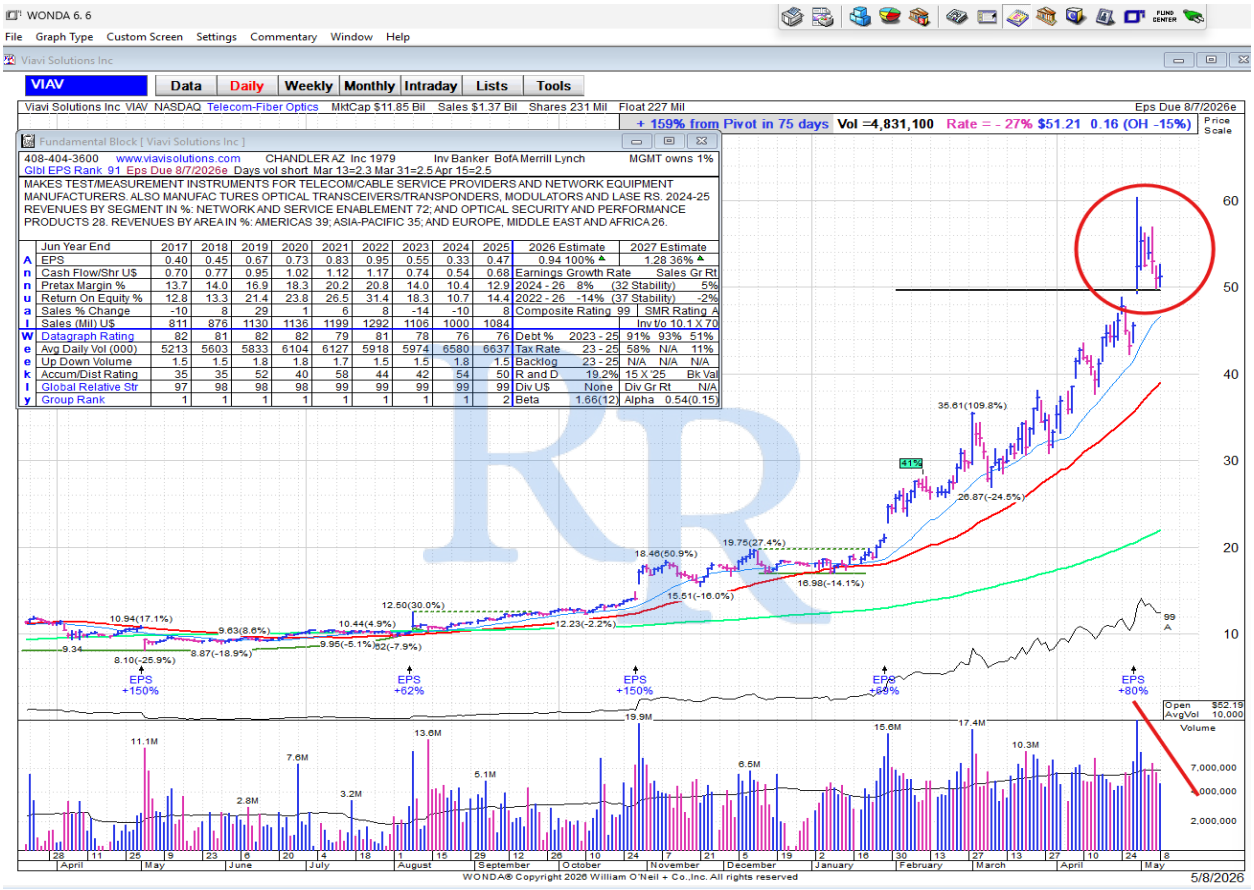


STX is up 7 of 8 days in a row, and up +90% from last pivot and +58% above the 50DSMA, which matches the max level of extension last January. Could it exhaust a bit higher? Yes, could it digest, dead tight, sideways? Yes, and if it does, I will again become ragging Bullish. STX is clearly parabolic/climatic and I would be trimming. I see a LOT of action like this. I am cautious on charts like this.

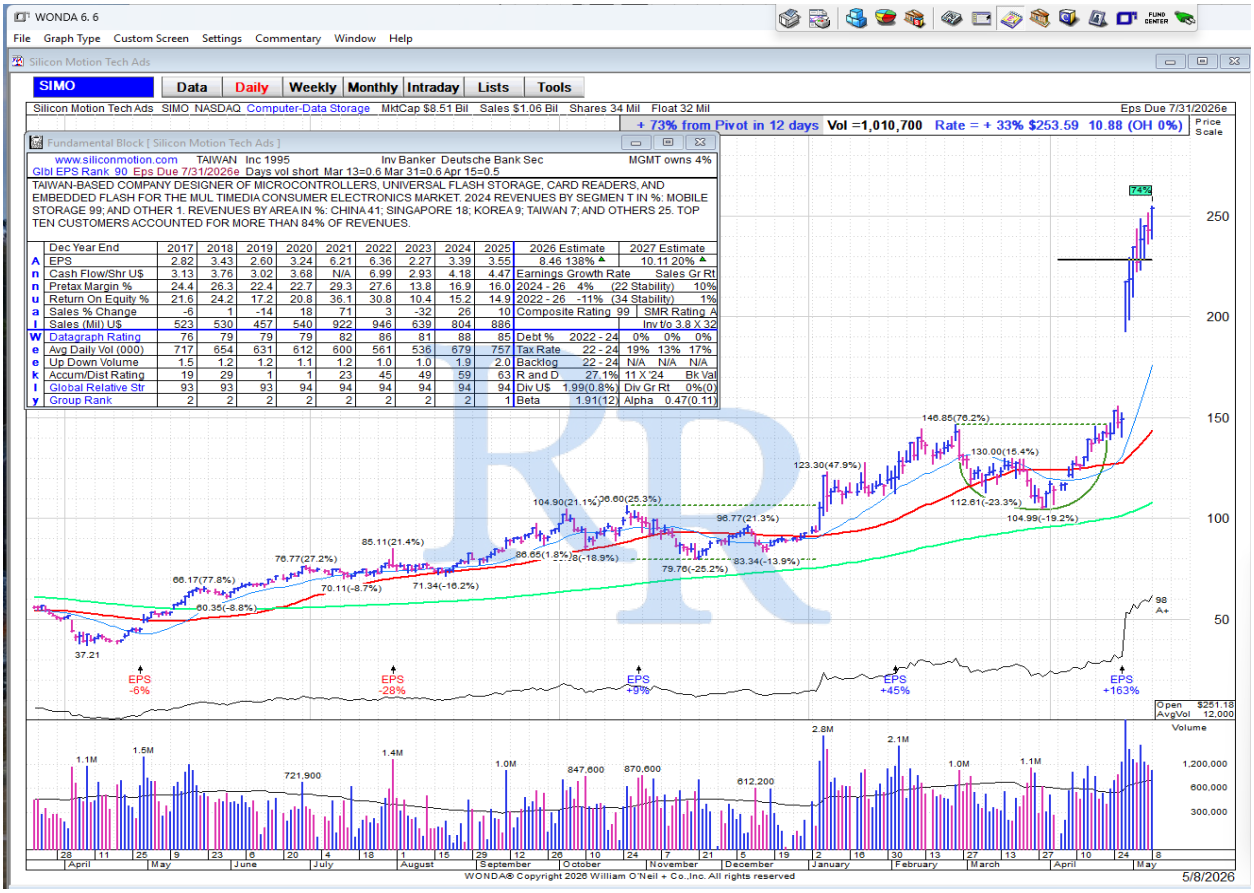


BE: I am hedged and think a move down to the prior high at $240.00 and the 21DSMA is possible. The gap up on 4/29/26 could be an exhaustion gap. How BE digests will be a big clue about its next move.

https://www.businesswire.com/news/home/20260414697111/en/Bloom-Energy-and-Oracle-Expand-Strategic-Partnership-to-Deploy-up-to-2.8-GW-to-Accelerate-AI-Infrastructure-Build-Out

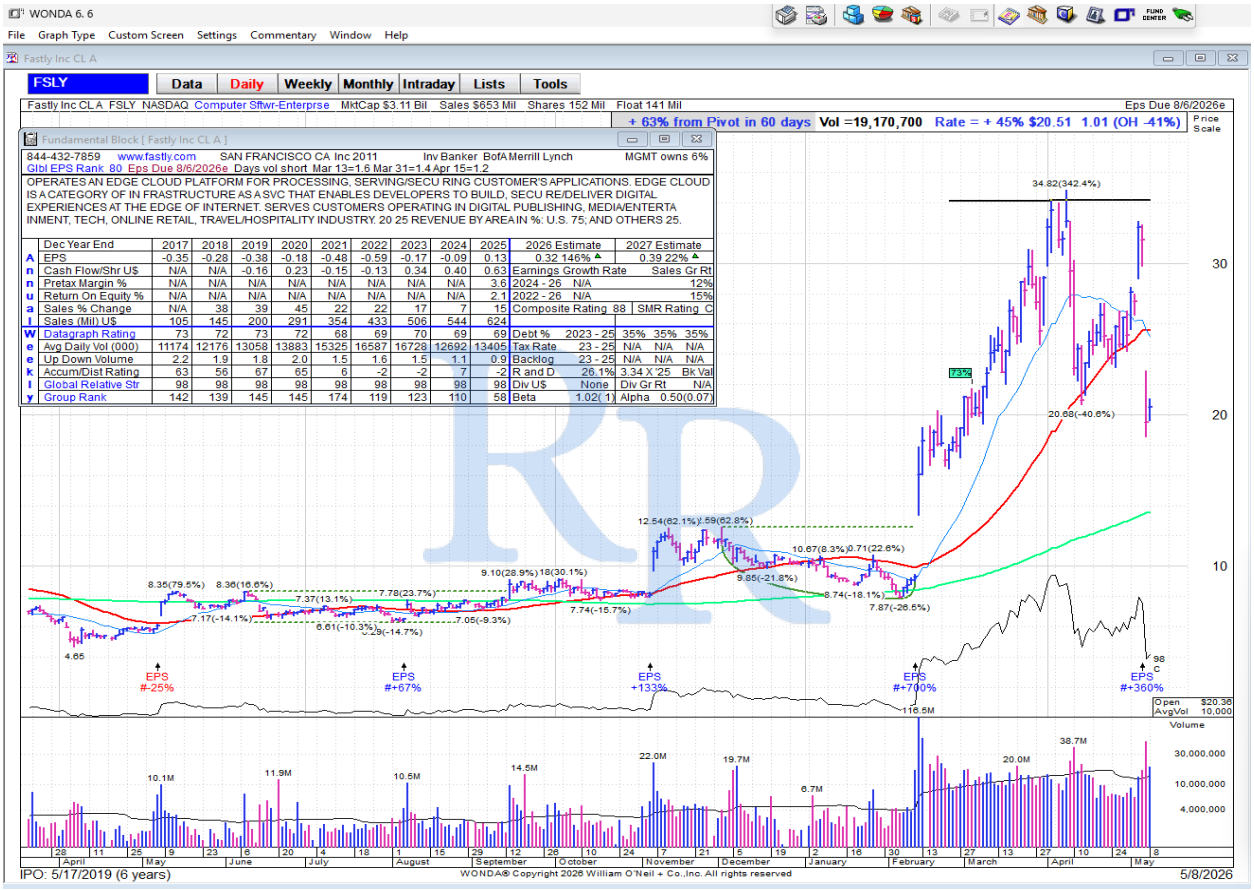


VIAV: I would call this a reasonable, constructive digestion so far. It's not perfect, I would prefer less give back of the gap up and tighter closes, but few things in life and charts are perfect.

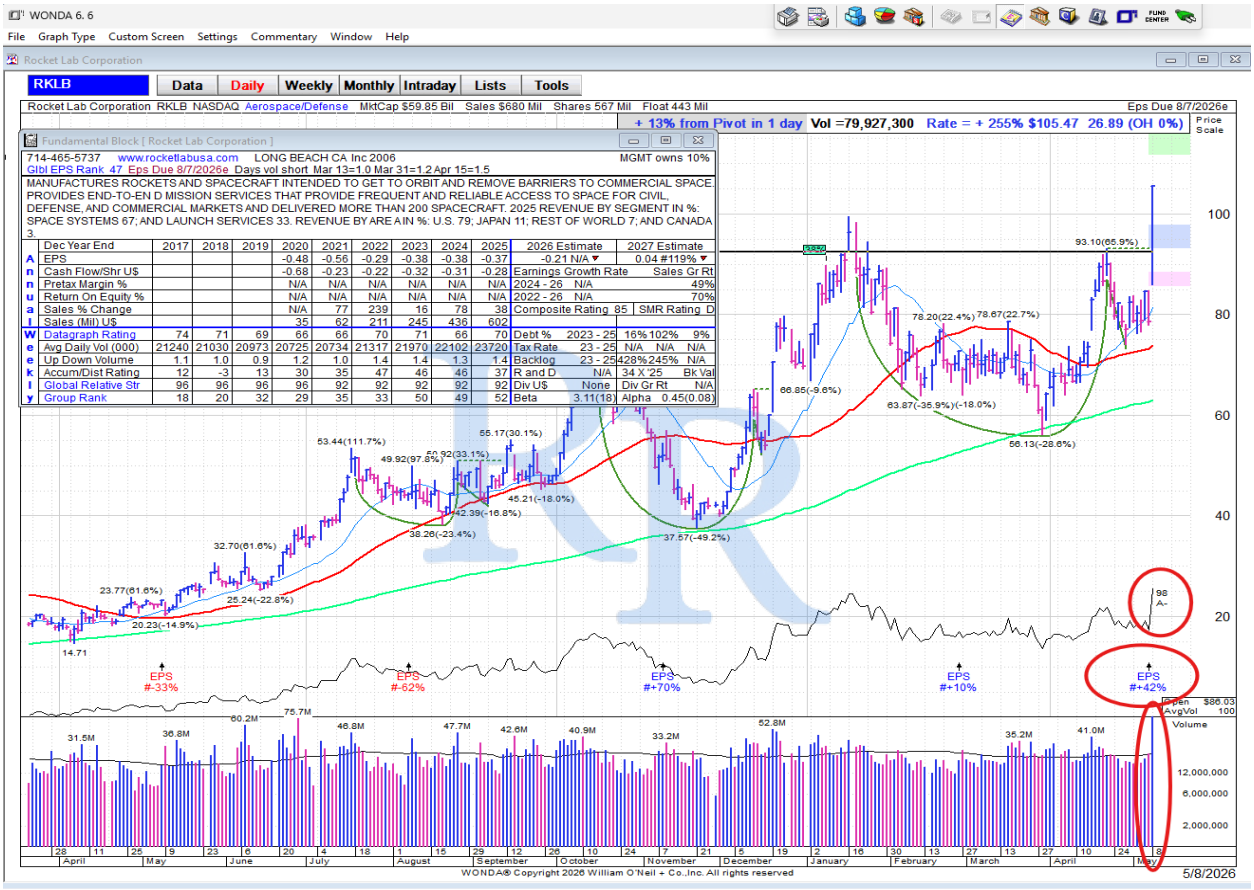


SIMO is a good example of a recent breakout that has not given back any of its gap-up. This reflects the health of the general market. How AMD, DOCN, FLEX, and STRL digests last week's gap up will be another strong tell.

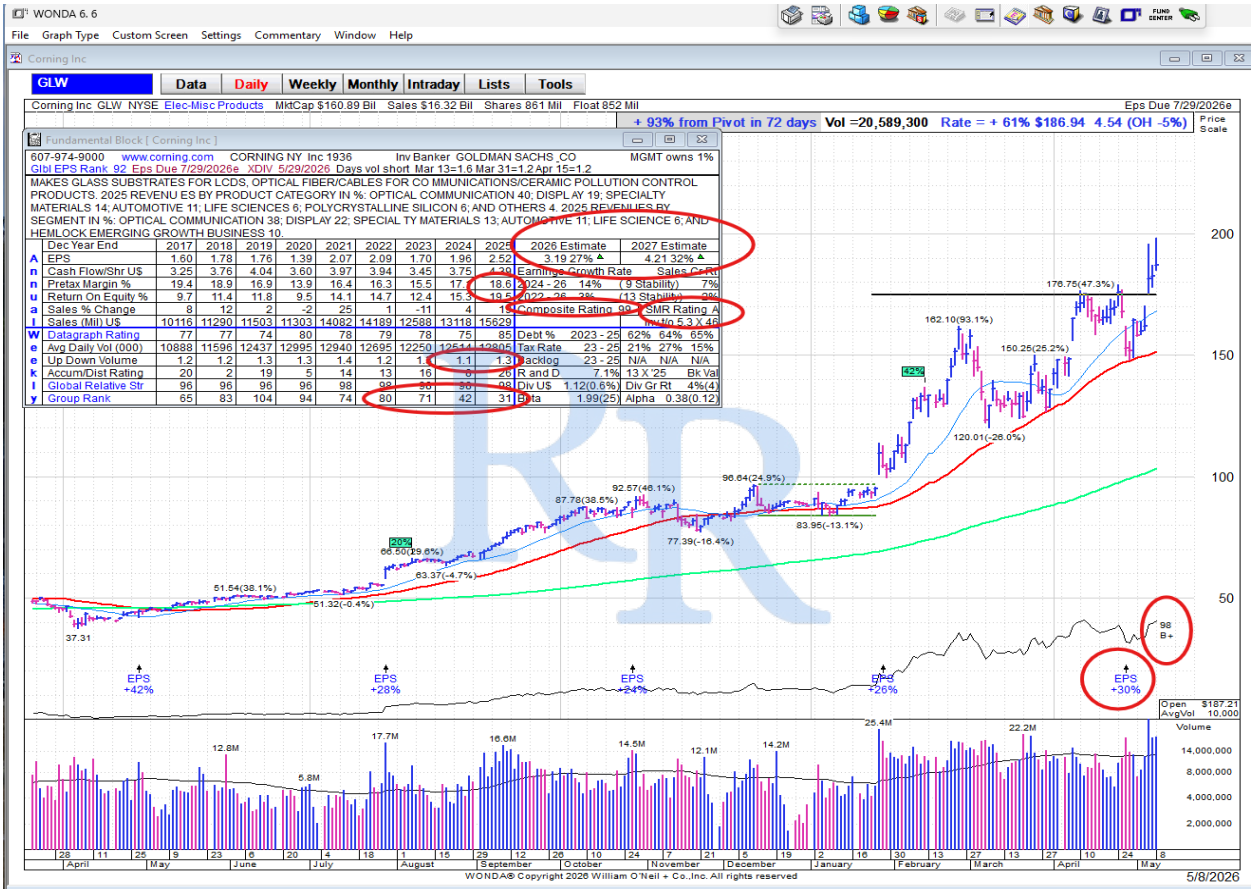
AMD (Curtis, Buy, PT: $415) *Company reported 1Q results last night that came in well above expectations. Revenue came in at $10.25B vs. the Street at $9.87B, driven by strength in data center, client and gaming. GM of 55.4% also came in better than expected vs. the Street's 55.1% forecast, and lower opex ($3.15B vs. $3.21B cons.) resulted in a solid EPS beat. Notably, the co. raised its server CPU TAM to $120B by 2030 (representing 35% growth and up from $60B prior), reflecting a structural uplift from agentic AI. We raise our '27 & '28 revenue & EPS estimates by 6%/9% & 10%/13%, respectively. Our '27 & '28 EPS estimates remain well ahead of the Street.*



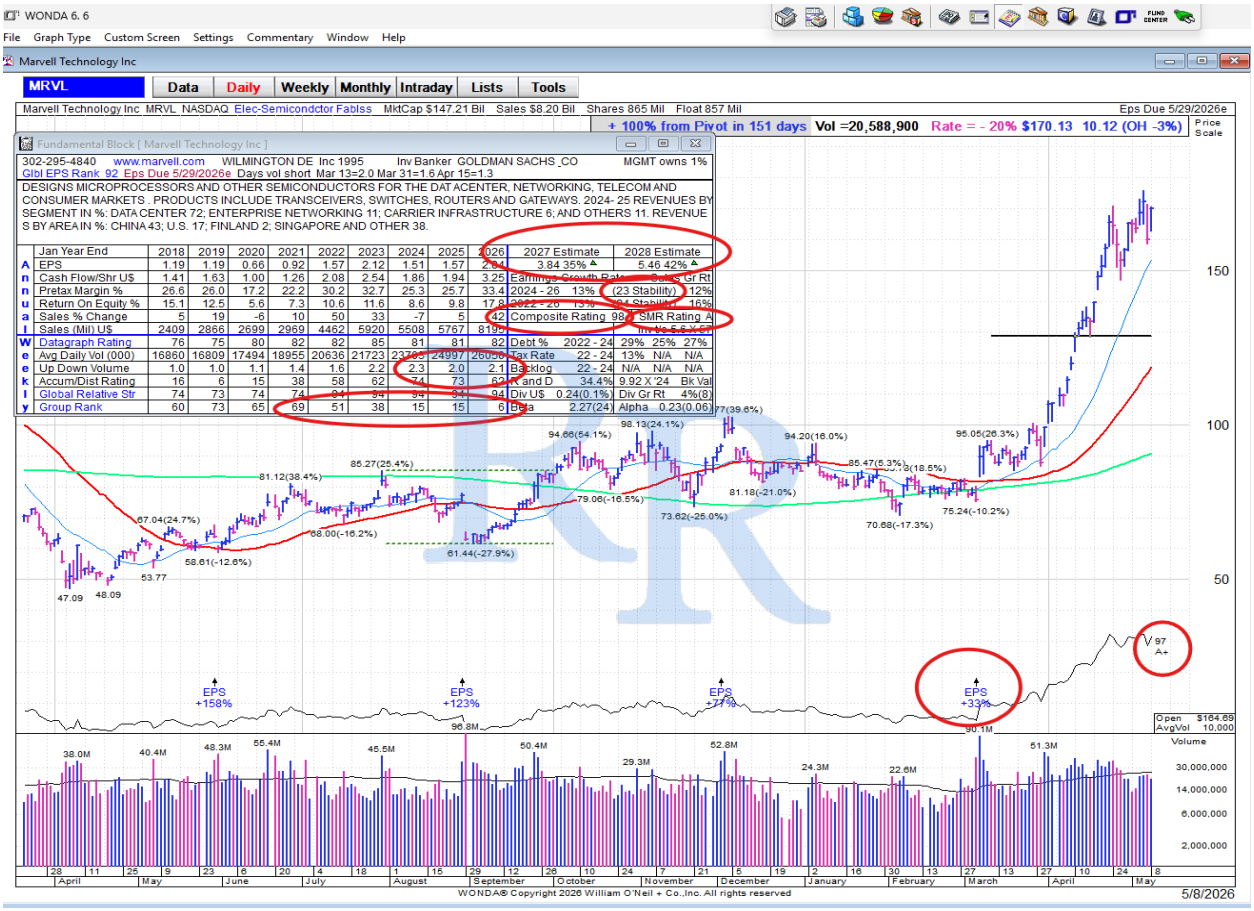
FSLY's first move, pre-FTD, did not overcome the bear flag that developed just above the 50DSMA over the last three weeks.



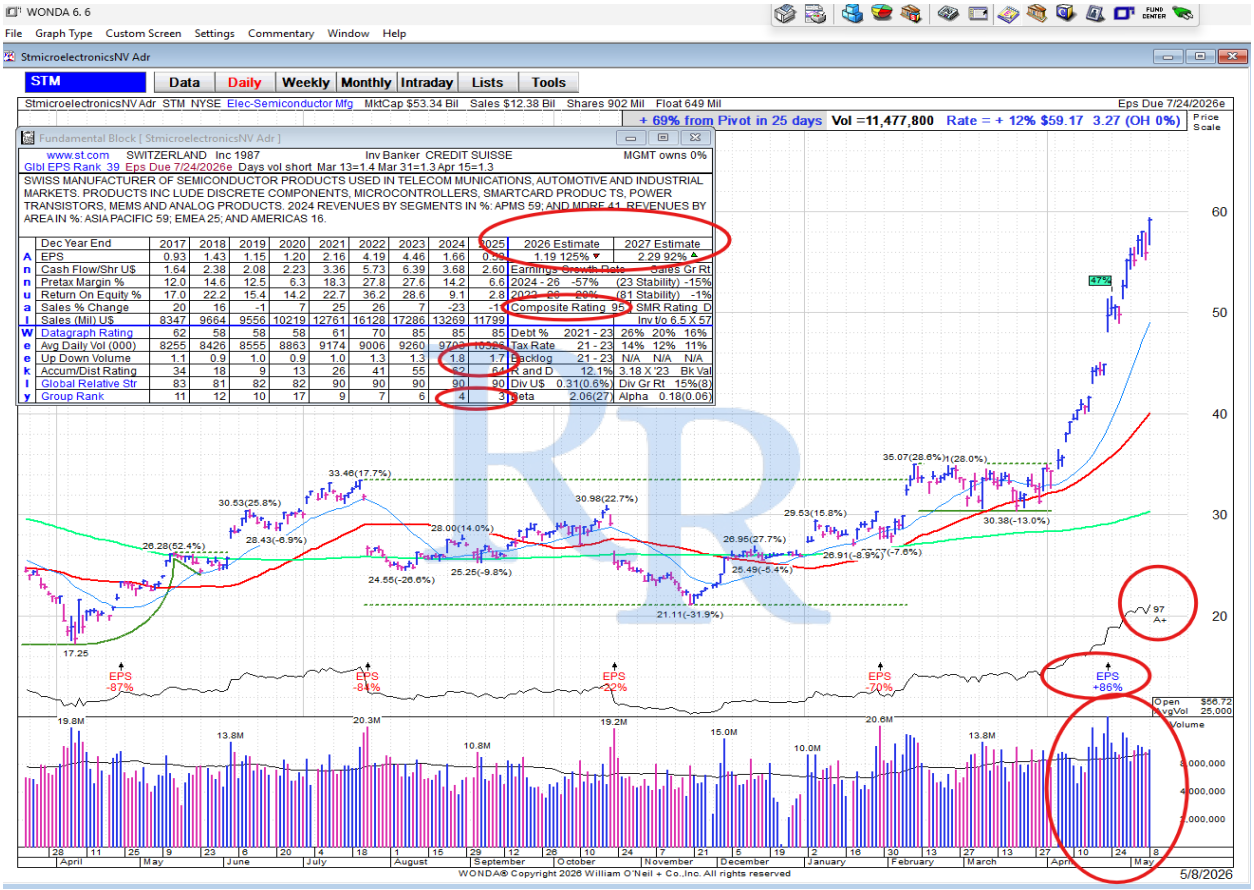
RKLB: After the double bottom breakout undercut the pivot, it was not looking good for RKLB, but the earnings reaction brought a perfect high-volume explosion higher and a top tick weekly close. That's A+ technical action, even for a no earnings name. Obviously, it's now extended. It will be telling how and when RKLB digests. RKLB is reminiscent of a breakaway gap, not an exhaustion gap, as we see in so many semis.



GLW is Top shelf 99Comp quality with great fundamentals but it's also my worst performer. After long bull runs, I sometimes sell my weakest performer. It's a rule I made after getting OBLITERATED in CROX years ago. I could not find any flaws with CROX, but the market did not believe it, as evidenced by the weak performance. The market was talking to me.



MRVL started its recent 2WT digestion with a +58% extension over the 50DSMA. Top shelf quality 98Comp.



STM: Names that emerge a few days before an FTD are a strong signal that something special is in play. Note the dramatic change in volume character, SOBVA, immediately after the breakout!!!!!!!!!!!!!! I do not know the fundamental story.

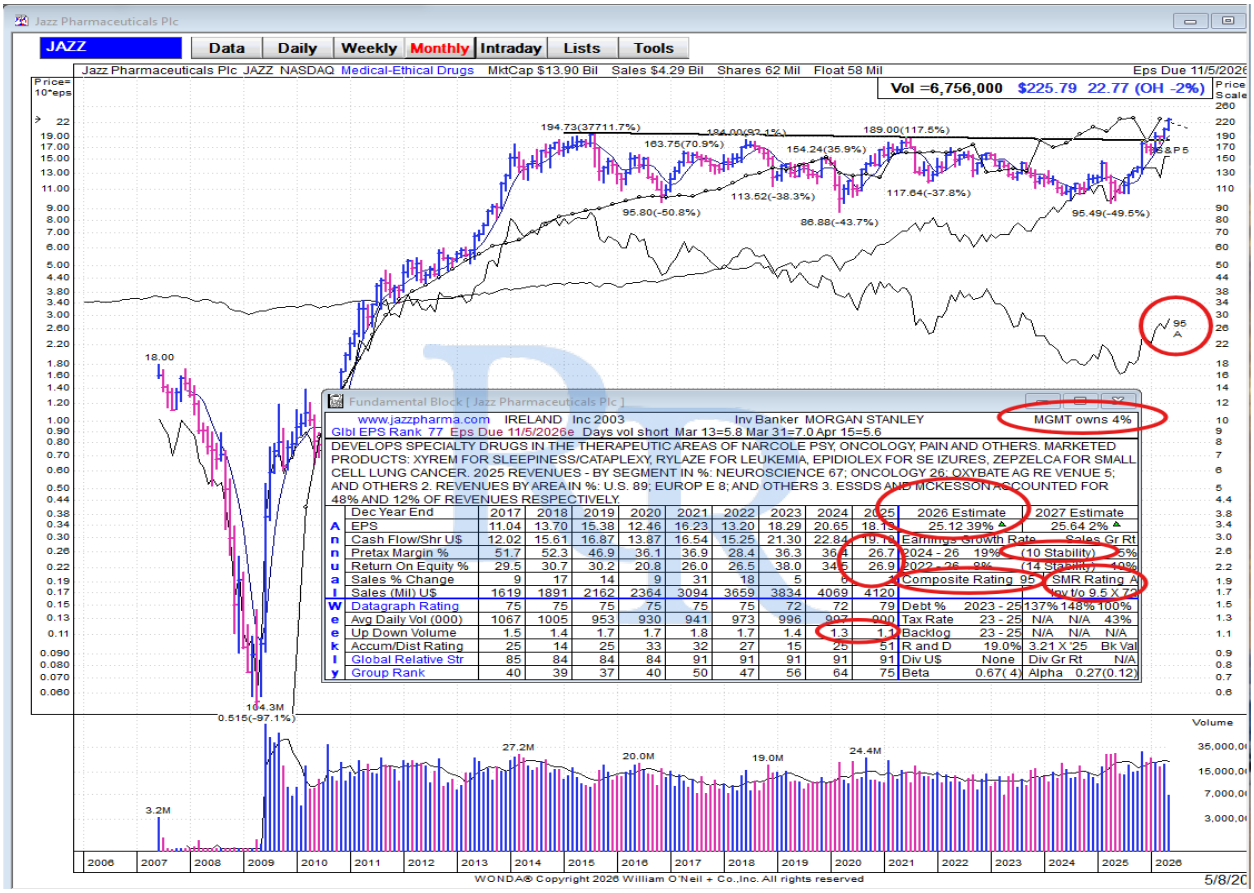
TSEM is far from parabolic and one of the few stocks to breakout before the FTD.

LRCX, ASML, TSM & AMAT just emerged and look great, unless they undercut their pivots.

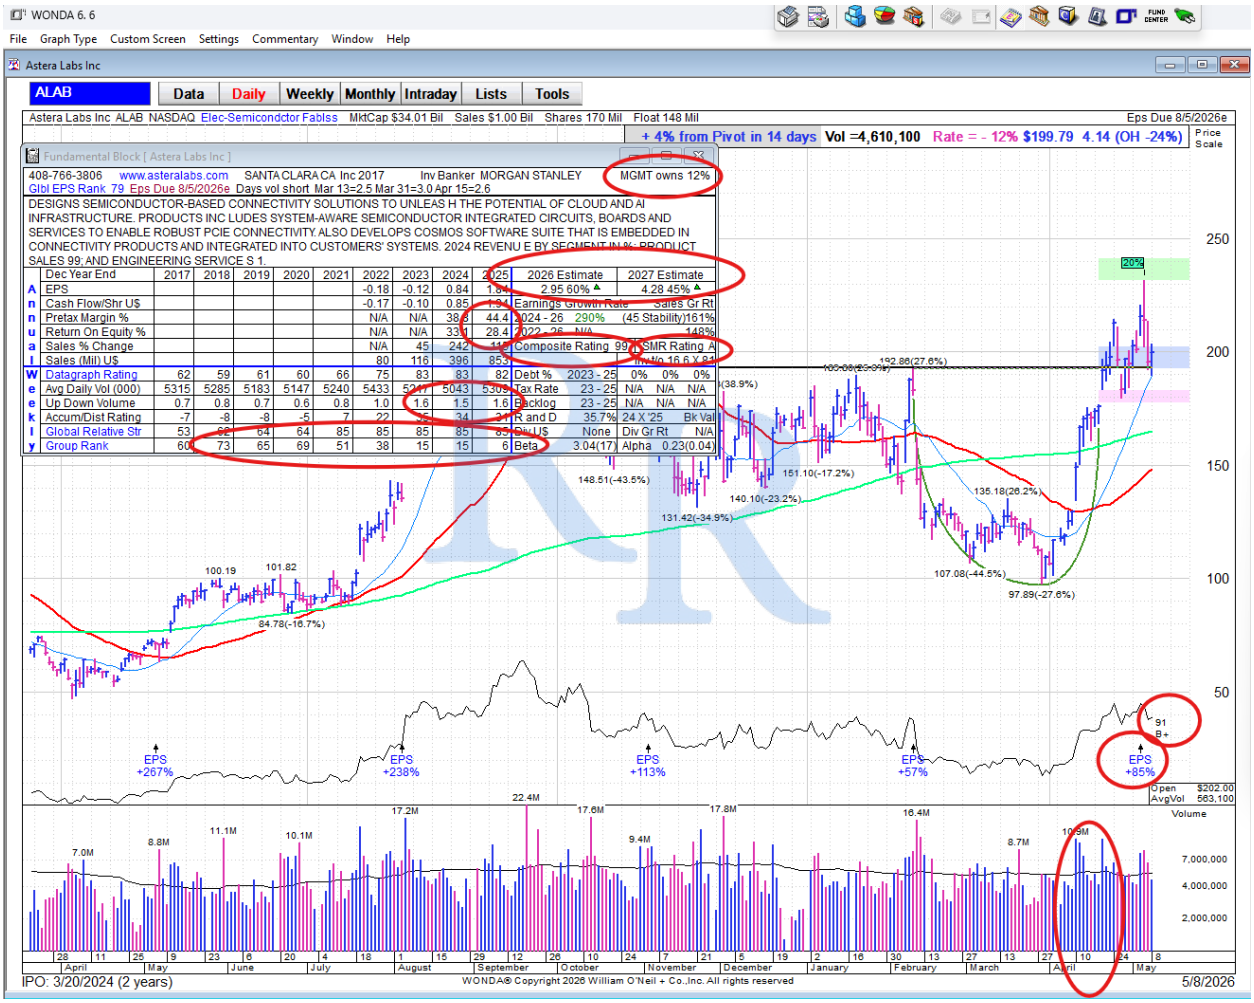
VRT & GEV look great.

DELL, looks great, but a bit extended.

JAZZ & AXSM had great price action last week and are holding tight.

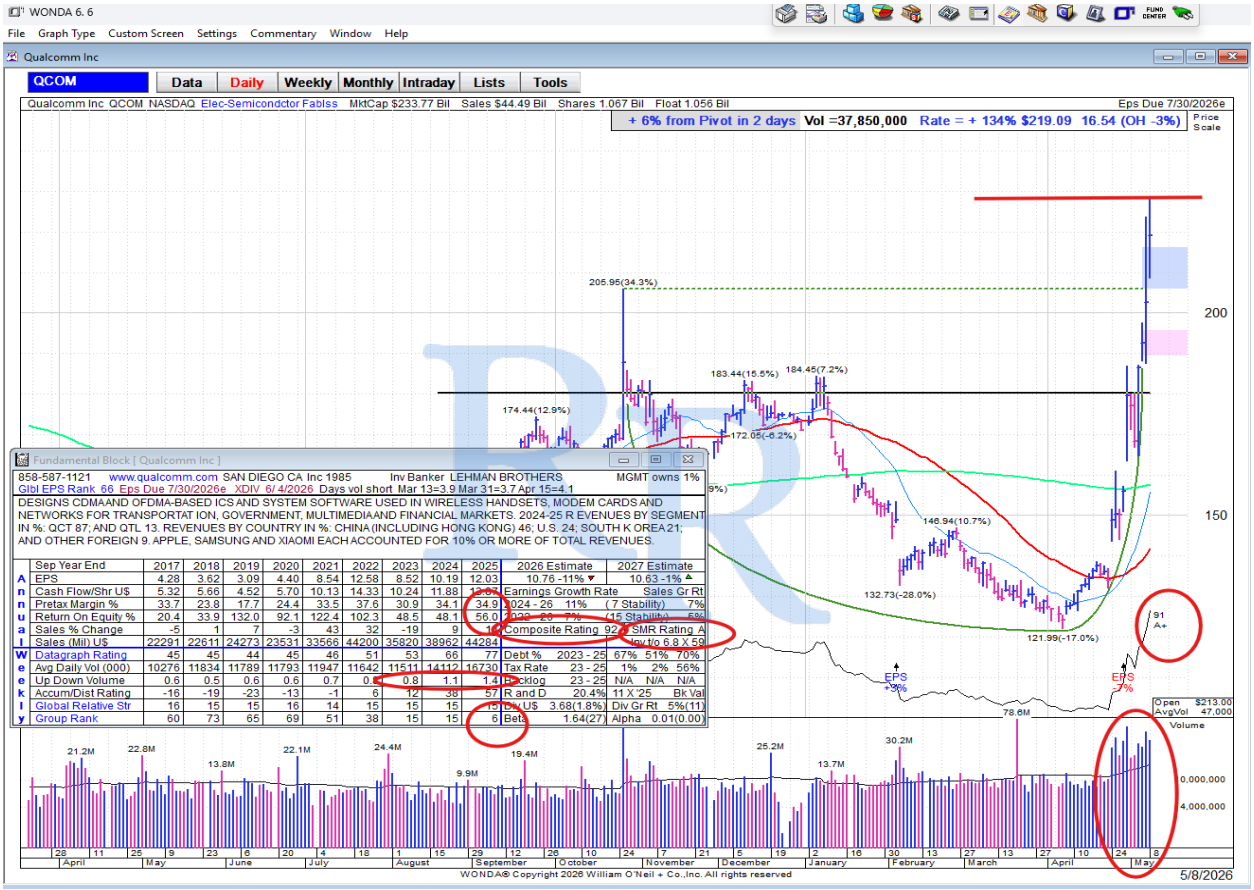


JAZZ: 10 year base and now starting to emerge.

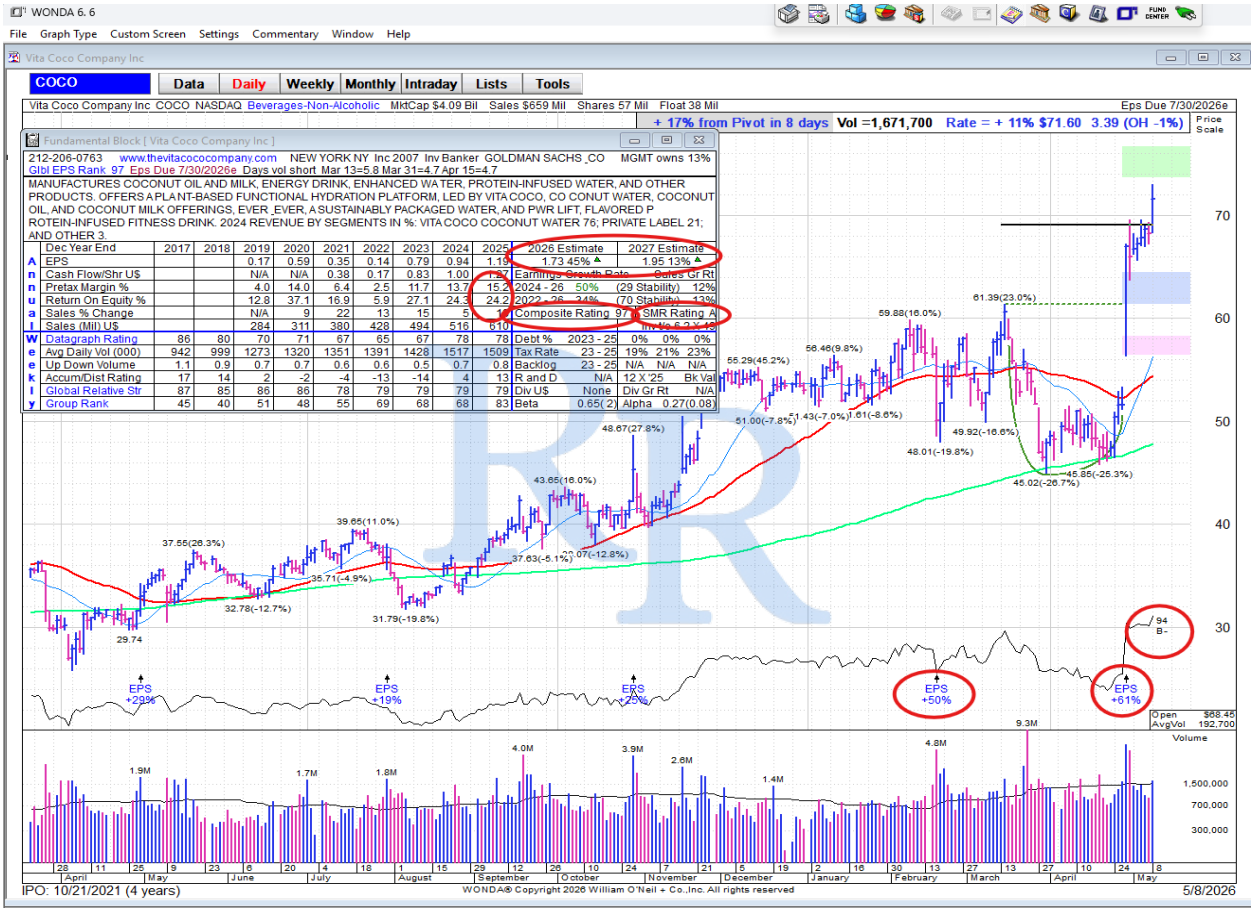


ALAB tried to break out over its undercooked seven-day handle and failed. I am not shocked. ALAB remains a high-quality 99Comp leader, but it needs to tighten up before I would go after it.

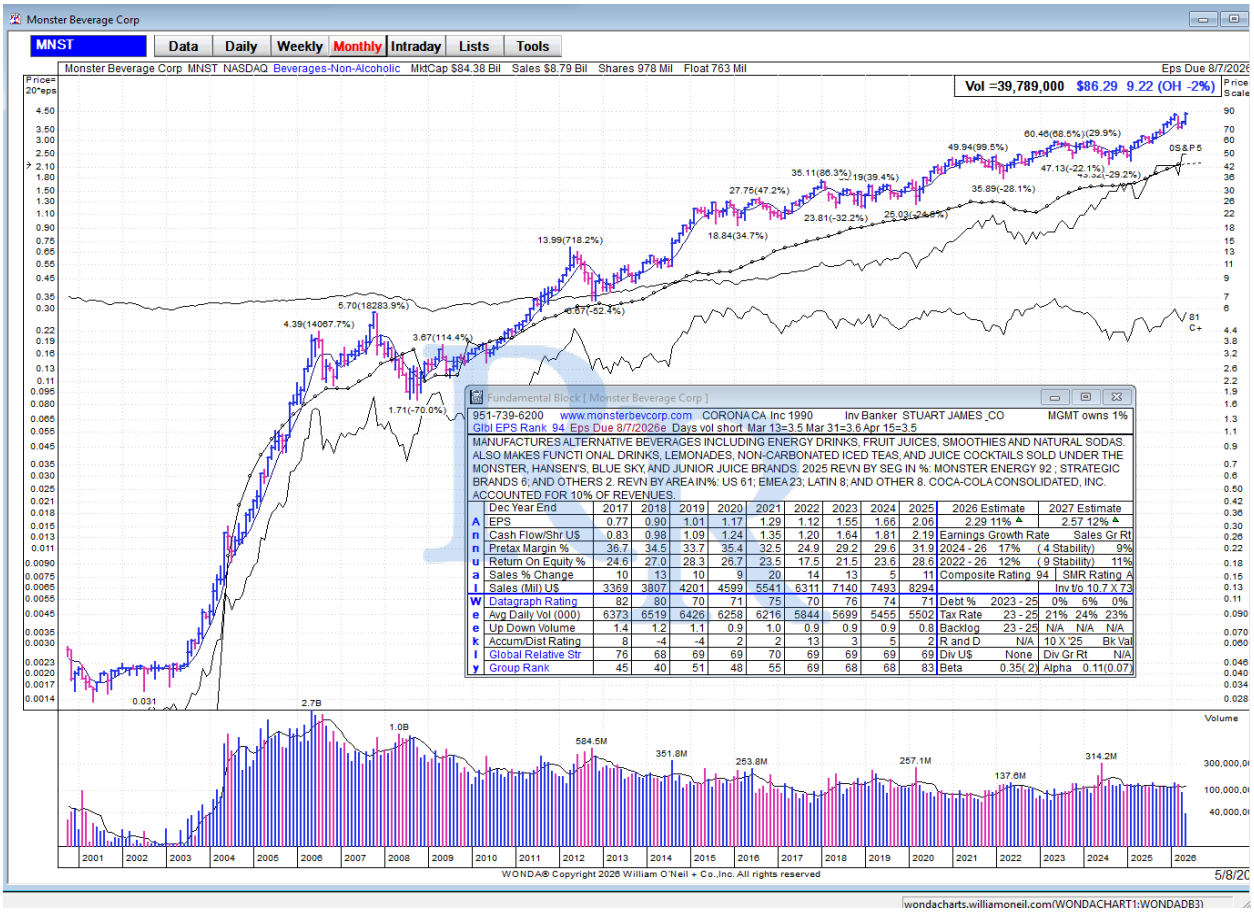
ALAB (Curtis, Buy, PT: $270) *Company reported a strong 1Q beat with revenue of $308M vs. the Street at $292M. Revenue grew 14% Q/Q as Scorpio continues to ramp and is now expected to become the largest product line by the end of C26. June revenue was also guided well above at $360M (+17% Q/Q) vs. the Street at $310M. On the optical front, ALAB continues to work through qualification at a large AI platform provider for its ultra-high precision fiber coupler product, leveraging the aiXscale acquisition with volume connector shipments expected starting C27. We raise our '27 & '28 revenue & EPS estimates by 10%/6% & 16%/4%, respectively. Our '27 & '28 EPS estimates remain well ahead of the Street.*



QCOM has ignited the tape as institutions may be positioning in front of the next wave in the rolling AI buildout.



COCO: This is exactly how I want to see a powerful earnings gap digest. Beverage stocks are under the radar but have produced so many MASSIVE winners.



MNST: That's .02 to $90.00!!!!!!!!!!!!!! Can you dig it?!!!!!!!!!!!!!!!!!!!!!!

KNSA: I missed this flea, but Biotech is the real deal. CYTK as well.

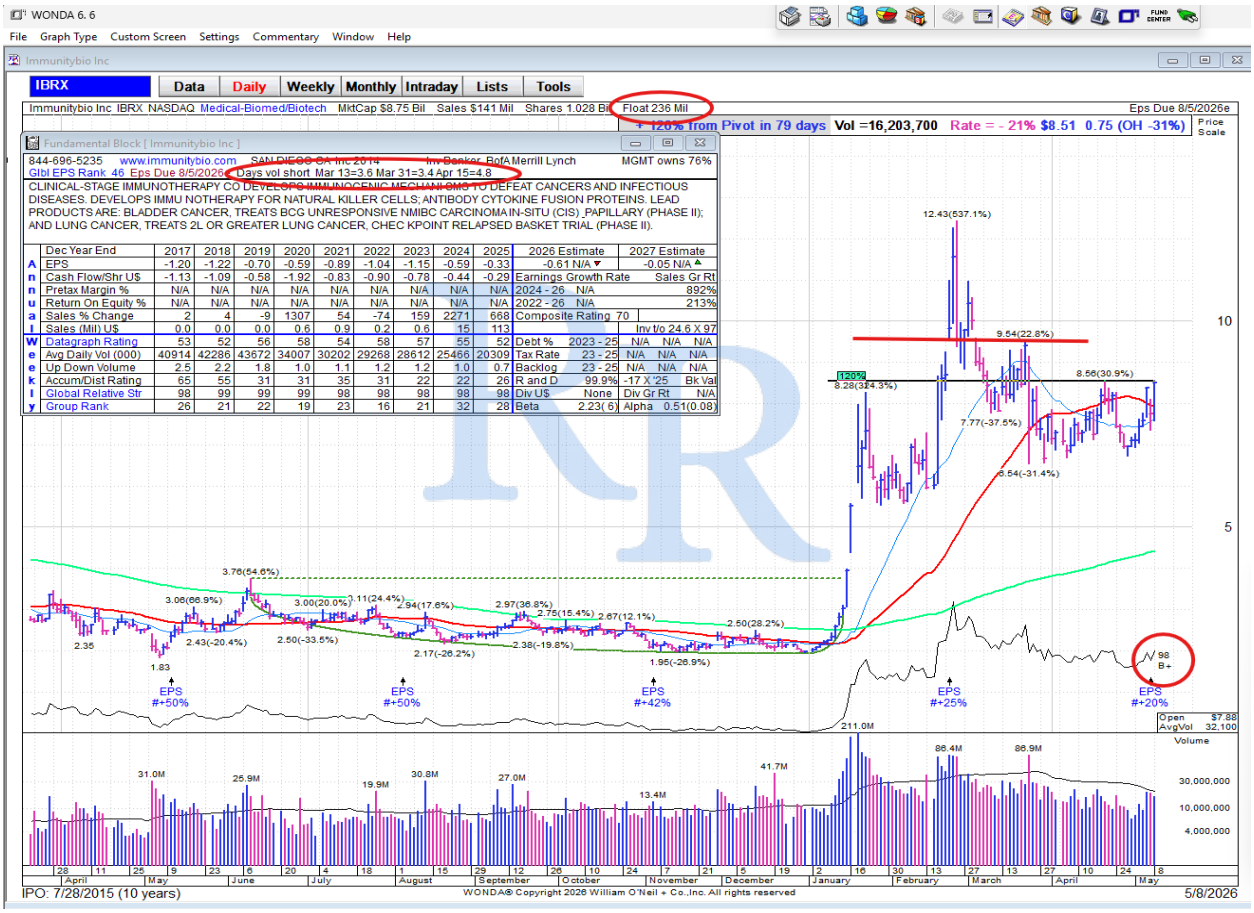
RIG is in a loose Darvas box, pivot over $7.20ish. NE = massive 16-year base

ARM had a less-than-ideal response to earnings, but not toast.

VLO

MP failed to attract sustainable volume after exceeding its pivot and was sold off. I would wait for another attempted breakout.

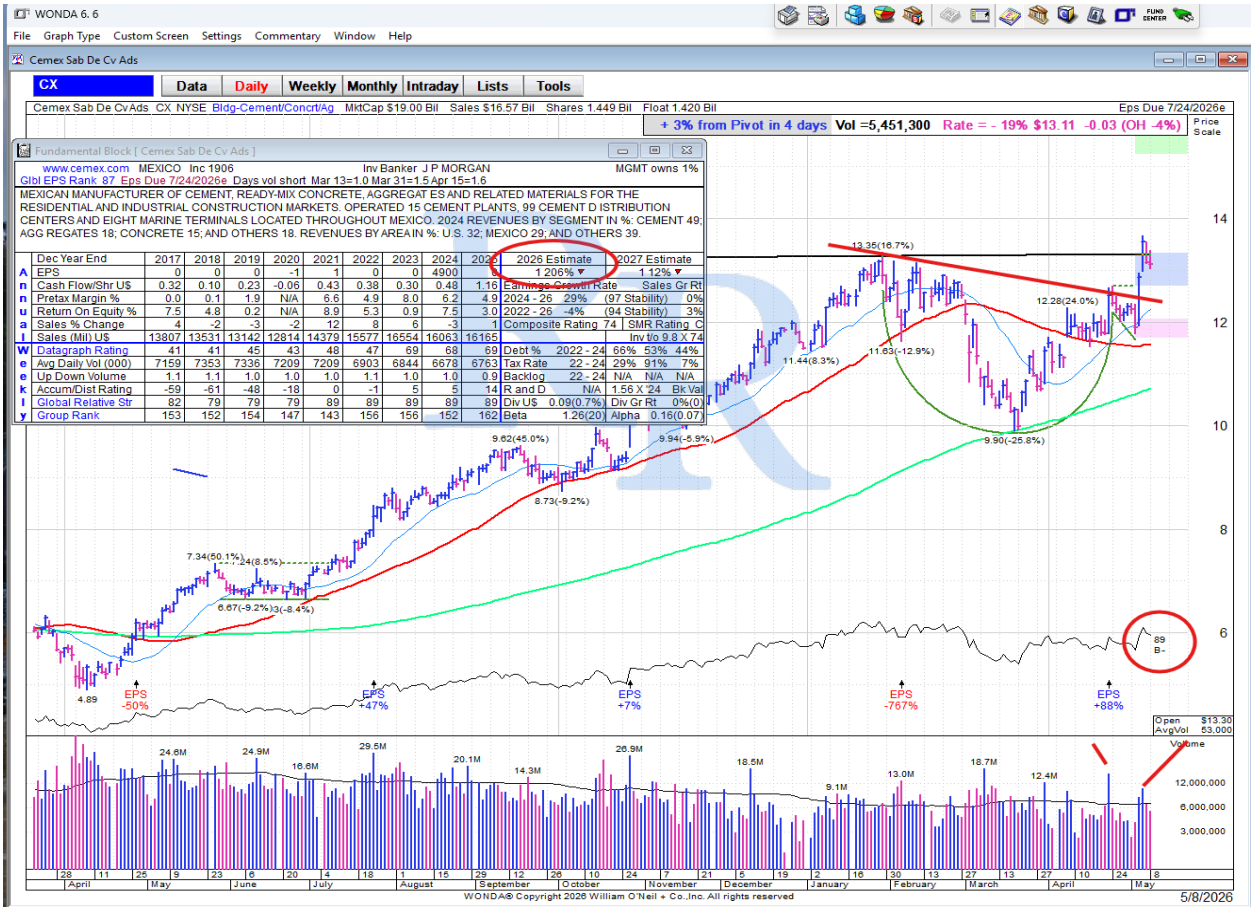
▼ Potential Leaders with Overhead



IBRX has no earnings, which makes it a Cowboy speculation, but has impressive fundamentals and a great prior uptrend. The fuel to gun shares higher could come from the 45% short position. $8.65, then $9.65. Cowboy caution, short squeezes can be *very volatile and are high risk.*

▼ CHINA and Other Countries

I wanted to show you guys EWZ monthly, but WONDA shut down.



Energy – Brazil Fuels: Solid 1Q26 Margins - *In our Brazil Oil: Taxing Times note, we flagged a transfer of value from PBR to Brazilian fuel distributors amid the Iran conflict, driven by pricing and government measures. This is evident in Vibra and Ultrapar's strong 1Q26 results, with EBITDA up 30-50% QoQ and margins at record levels. While margins should normalise as tensions ease, we expect them to settle above pre-conflict levels. We keep our Buy call on Vibra and UNPF on Ultrapar (due to M&A risk).*

▼ One of Bill's Golden Rules

These rules are timely and not contradictory.

"Far more money has been lost by investors preparing for corrections, or trying to anticipate corrections, than has been lost in corrections themselves." — Peter Lynch

Hedging 35 to 50% or more of historically extended positions is like a Miracle-Drug. It stops you from emotionally dislodging low-cost core shares near the lows. Jim Rule

In the Pandemic crash, I was fundamentally convinced that Carvana, with 600% debt to equity, would go to Zero. CVNA fell from $115.00 to $22.00, then raced back up to $100.00 in 7 weeks, and then went to $376, 6 quarters later. Price trend trumps fundamentals and opinions every time.

▼ Random Thoughts

I wanted to discuss both SNPS, CDNS but WONDA shutdown. I will cover them both next Sunday.

It's been a historic, wacked out, CRAZY, elite, melt-up market. On Wednesday's close, the QQQ hit +13%, which equals the max extension since the 2000 blow-off top. The market is short-term over-torqued and needs digestion to cool the short-term excess. If you cannot withstand a digestion down to the 50DSMA in all your securities, you need to trim, hedge, or sell.

An Ode to the Shoeshine Boy

Justin Gabriel | Feb 17, 2023

Investing

One of my favorite stories of wealth creation is that of the Kennedy family.

In 1929, at the height of an economic boom in America, Joseph Kennedy Sr. (father of JFK) was working as a stockbroker on Wall Street. As the story goes, Joseph was walking around when he decided to sit down for a shoeshine. While polishing his shoes, the young worker gave Joseph some of his favorite stock picks. When Joseph heard the shoeshine boy giving out stock tips, he figured the party was about to end, and it was time to get out of the market. Joseph proceeded to exit his positions in the market and bought short positions that bet on the market going down.

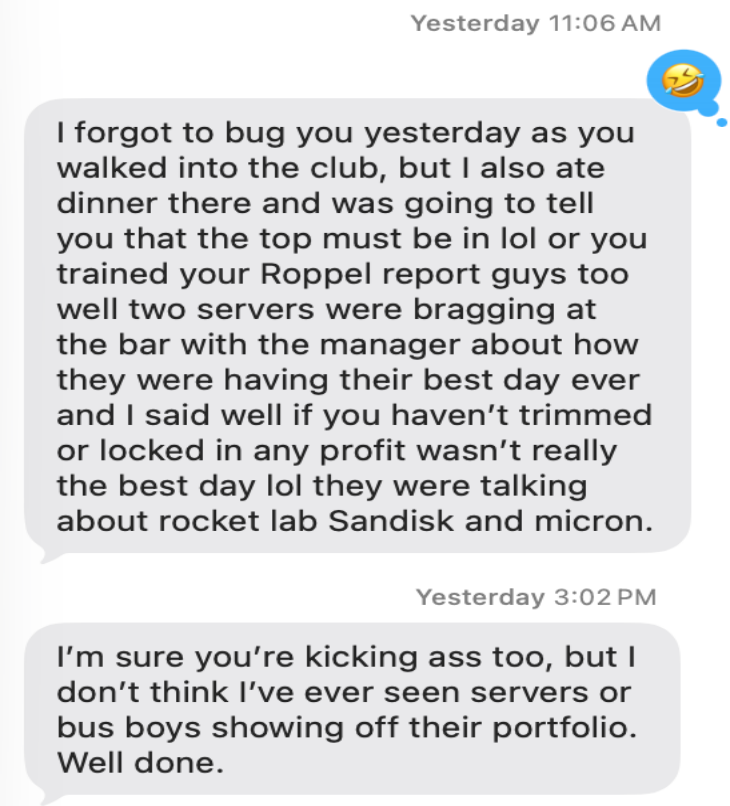
Shortly after that, the stock market entered a free fall. On Monday, October 28, 1929, the market dropped about 13%. The next day it fell another 12%. These became better known as Black Monday and Black Tuesday, and ushered the United States into The Great Depression.

Now did Joseph profit from this type of bet? Absolutely. It's estimated that he made somewhere north of $150 million during that period, which equates to roughly $3.5 billion in today's dollars.

Did he make these bets based on the shoeshine boy? Probably not, but it makes for a good narrative.

Stories like this are great because they show that although society has progressed incredibly quickly, the human element of investing and speculating will always be around.

My friend's text below reminds me of the Joe Kennedy story, although it could be a fable.



Another RR subscriber and I were talking last Friday, and he told me he had his best day ever last week and trimmed some semis. This is not scientific, but it is meaningful nonetheless.

An official end to the conflict in Iraq is likely to be a sell-the-news event. It's well-telegraphed that a settlement is in the making. I am not saying the Iranians will adhere to any of the stipulations in any agreement, but the Strait will likely open for safe passage in the next few months. This will not shock anyone, and the market has been rising partly because it's already discounting the resolution. After the announcement of peace, there will be no buyers left, only sellers who will take profits, as that's what they have been speculating on for months.

I will need to hedge, trim, or sell when I can, not when I want to. When prices are getting extremely extended, and there is a lot of climactic action or outright climax runs, many will be thinking about how smart they are and how they just changed their life. Which has happened to a lot of RR subscribers so far this year. Option premiums and stock prices are fat when the conditions are extended. One day passed the top and hedging becomes very expensive, and leaders frequently break -10%, or even -30% before one can act, and many freeze up and start hoping for a bounce. The market is a very cruel/expensive psychologist and that's why experience might be the most important variable after risk management and not buying extended. Many can survive while they learn and gain experience, but can't survive without risk management.

Palantir Technologies (PLTR, UNPF, PT $70) Executing at a Rule of 145, But Comes at a Price *- We don't disagree with Karp that PLTR remains at the forefront of AI conversations and acknowledge the impressive growth, but believe the debate is on valuation. Even assuming ~$12B of CY27 rev, the stock trades at ~31x EV/CY27E rev, which we view as stretched. We also see risk that PLTR's ~60% margin profile signals underinvestment, particularly in GTM, limiting its ability to fully capture the broader opportunity. Maintain Underperform, $70 PT=15x CY27E rev.* https://javatar.bluematrix.com/pdf/cCCq6D4P

LITE (Curtis, Buy, PT: $1,200) *Company reported solid 1Q results last night. While revenue for the quarter came in slightly below the Street's $810M forecast, Cloud and AI business drove total company revenue up >90%. Components revenue was up to $533M, +20% Q/Q, driven by exceptional strength in EML and DCI components. Systems also grew to $275M, +24% Q/Q, led by company record cloud transceiver shipments, which grew over 40% Q/Q. Importantly, LITE's operating leverage is beginning to flow through cleanly as factory utilization normalizes, mix shifts towards laser chips and scale-across components and targeted pricing actions take hold. We expect OM% to inflect higher and raise our '26 & '27 EPS estimates by 7% & 6%, respectively. We remain ahead of the Street.*

Dutch Bros (BROS, BUY, PT $83) Beat & Raise with All Cylinders Firing on Energy and Food
- *1Q SSS well ahead of Cons (8.3% system, 10.6% co-owned), as was RLM & EBITDA. BROS continuing to prove its uniqueness w/ respect to high visibility into multiple biz drivers through 2027+, we raise our ests and think raised F26 guide could still prove conservative. No competitive or macro threats (ex, gas prices) seemingly impacting the brand, and we view the LT growth opportunity as highly attractive; reiterate Buy, PT $83.*

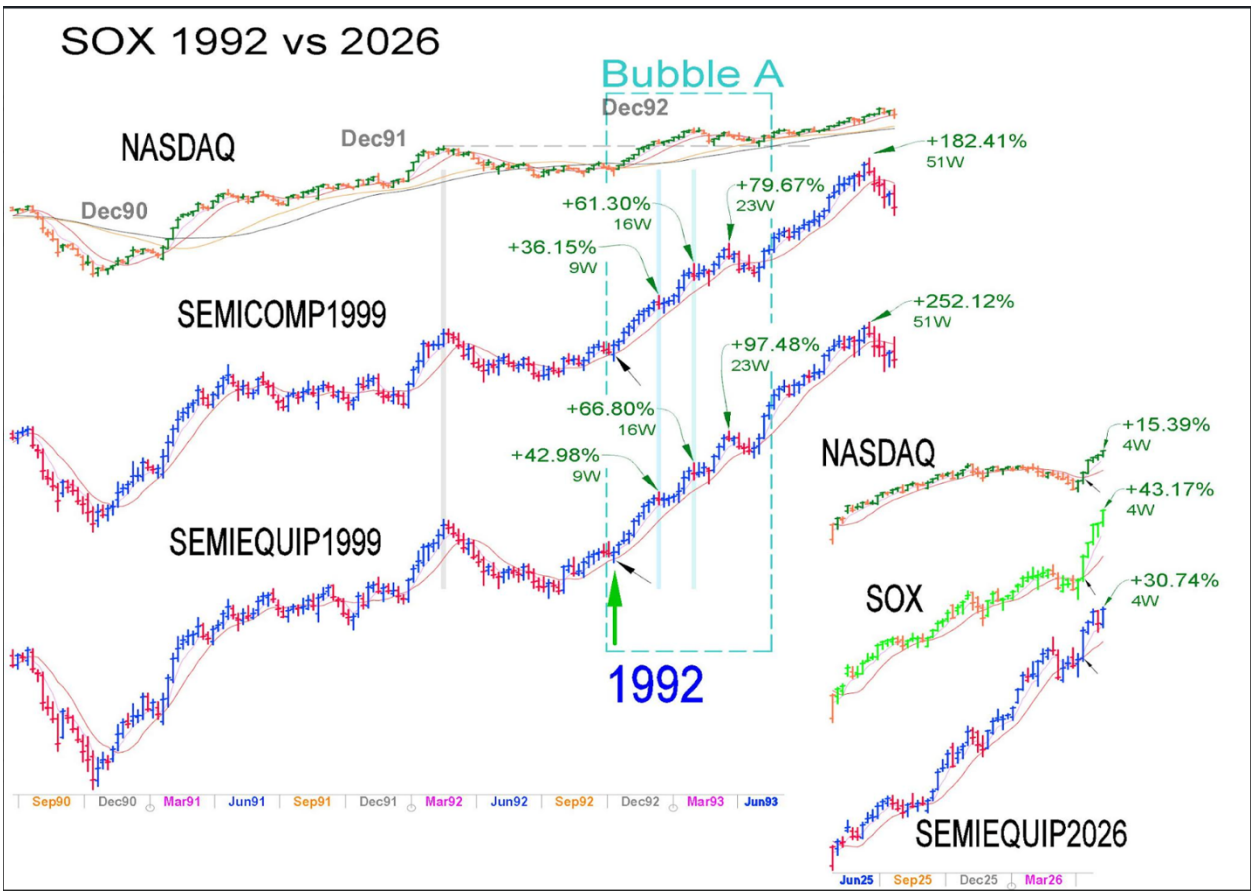
Z



Looks like there is historical precedent for higher prices in semis, likely with some digestion. Thanks @FrankB.

Waffles says Hi!!!!!!!!!!!!!!!!!!

▼ What could go wrong?

Crude induced inflation creeping into refined products. Watch short-term treasury yields to validate inflation before getting too bearish. The counter possibility is that AI will bring significant deflationary pressure.

▼ Dominant Fundamental Factors (DFF)

Current Dominant Fundamental Factors in order of importance:

- **Trump administration, deregulation greasing the gears of commerce and jet fueling the "Golden Goose of Capitalism" and Free Markets.**
- **AI**
- **Semiconductors**
- **Crypto, Digital Asset Ecosystem and DeFi**
- **Biotech**
- **EVs**

CREATIVE PLANNING					@CharlieBilello		

Check out the forward performance above with the conditions we are experienced in April 2025. The odds are very favorable for IT and LT. Bill would be positioning himself with capital to pounce. Remember, just like in 2024, there will be dozens of stocks that will go up hundreds of percent.

75 years of evidence that prices will be dramatically higher in 12 months. If history repeats, what will it do for your net worth? What did 2024 do for your net worth?

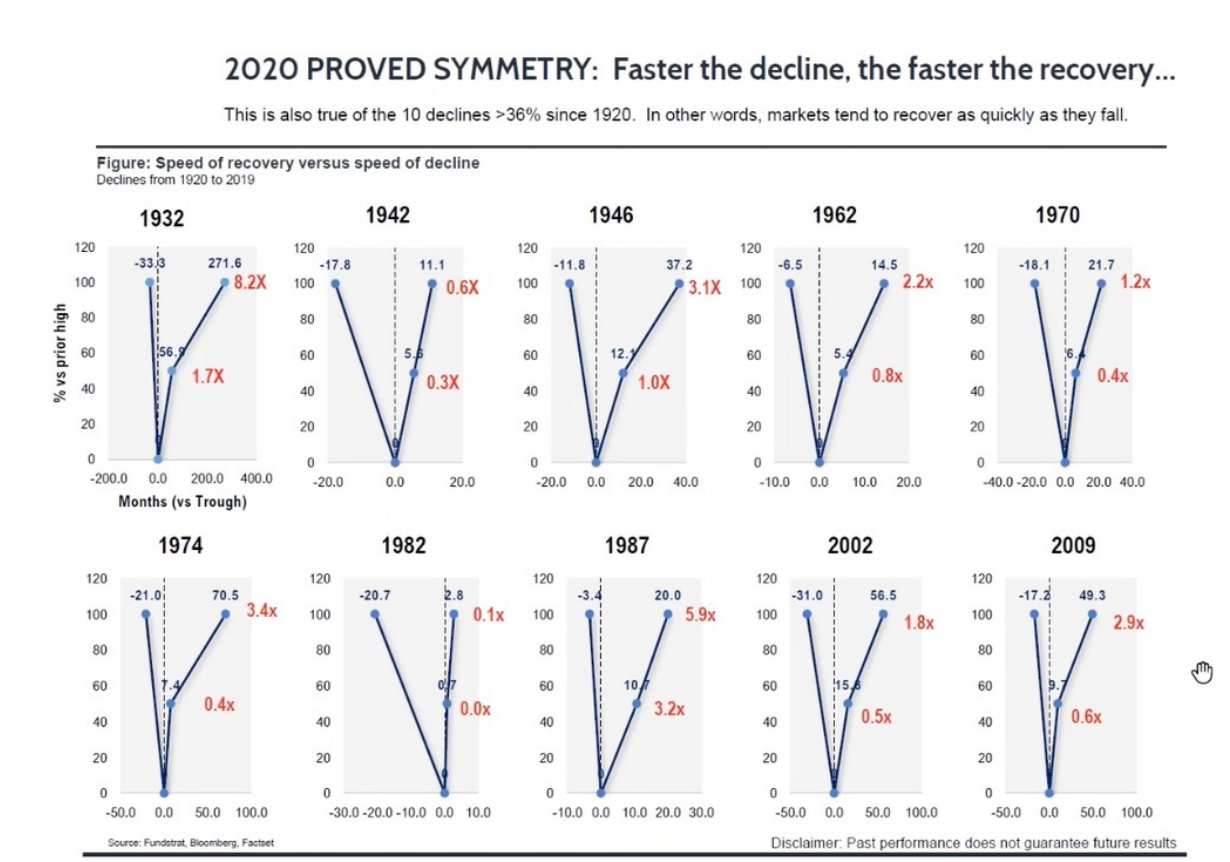
CREATIVE PLANNING						@CharlieBilello		

Opportunities this good are rarely presented.



A third leg down is possible, just like 2020 and 1998, but this decline has been so swift that it increases the odds of a V-shaped recovery.

Talk about a bear killer.

With all the historical evidence that bear conditions, like we just experienced, prices will be higher in 12+ months. Right now, is the time to be funding your war chest for the growing opportunity to move up to a higher financial station. I feel the opportunity will be equivalent to 2024.
